FOREWORD

The period between the end of the Mauryan Empire and the rise of the Guptas covered some five hundred years, during which most of India was fragmented into comparatively small kingdoms, about which our knowledge is very inadequate. The life of much of northern India was from time to time disrupted by the invasions of various foreign peoples—Bactrian Greeks, Śakas, Parthians and Kuṣāṇas—whose inroads must have caused great unhappiness and loss of life for the ordinary people of the regions over which they marched. Nevertheless this period was one of the most important and formative ones in the whole history of India.

During this time the life of India underwent many changes. Buddhism flourished, and left many of its most precious works of art and architecture. The Mahāyāna schools appeared, and began their missionary expansion. In Hinduism the new devotional cults, whose activities are reflected in such texts as the *Śvetāśvatara Upaniṣad* and the *Bhagavad Gītā*, grew and expanded their influence, the great epics were compiled and redacted in something like their present form, and the earlier Dharmaśāstras were written. By the end of the period Hindu religious belief and practice were much as they are at the present day.

This formative period was also one of close contact with the outside world. Trade with the west developed and flourished, and with it came new ideas from beyond the frontier. Contact with the Far East developed, and by the end of the period Indian culture had begun to make an impact on the life of South East Asia. In fact the period, though obscure in many particulars, and though it may have seemed a dark one to those who lived at the time, was one of great cultural development and, in many parts of India, also one of considerable material prosperity.

II

The art of writing was much developed in this formative age, and it is good that at last a detailed and thorough study of this aspect of the cultural history of the period has been prepared. Dr. T. P. Verma's monograph, which I am honoured to be able to introduce, minutely studies the many inscriptions of the period. He has subjected the evidence to a closer analysis than any earlier palaeographer and has put forward theories on the development of the scripts of the time which will be extremely helpful in the work of future students of the subject. Particularly interesting and important is his attempt to relate the development of the script to social and other factors. He does not study palaeography in a vacuum, but places it firmly in its general framework in the general history of the times. It is to be hoped that he will continue his studies and soon produce further monographs dealing with other periods in the history of India.

PREFACE

'The Palaeography of Brāhmī Script in North India' is based on my thesis submitted for the degree of Doctor of Philosophy of Banaras Hindu University. Here an attempt has been made to trace the evolution and development of the Brāhmī script in north India from c. 236 B.C., the supposed date of the death of Aśoka, to c. 200 A.D. Considering that this time-span leaves out only the inscriptions of Aśoka, which are definitely earlier, a study of the Brāhmī script during this period should be deemed to be of paramount importance. This is the real 'formative' period of the script when increasingly greater use of writing led to a rapid evolution of the letters and, towards the end of the period, even to the distinction of possible regional styles. Our sources of study, of course, have been the inscriptions engraved on stone, metal pieces, coins and seals, but still, following the old tradition, we have assumed, for the sake of convenience, the general validity of the letter forms evolved or in the process of evolving. A palaeographic study based on such restricted source material has, no doubt, its own limitations. For example, it could perhaps be said that if engraving on stone or metal or terracotta objects or coins—in short, a hard surface—was not the primary use of the script; any generalisation on the basis of such engravings can have only a limited validity. Such suspicion would be genuine, and we will also agree that real palaeographic studies can only be based on paper or similar material. But, apart from the unfortunate circumstances that such sources are simply non-existent for our period, we would like to point out, in defence of the earlier generation of Indian palaeographers and our own choosing to follow in their foot-steps, that much formal difference between the actual writing on paper and engraving on a hard surface need not be imagined; especially so, since engraving appears to have been

often a later and secondary process for which inscriptions were first written in ink on a surface to be engraved. Where, however, we have differed from older scholars is in another direction. While the early Indian palaeographical studies have generally been the study of inscriptions as sources of history and the palaeography has been confined to discussion of the origin of the script or forms of some particular letter, we have chosen to concentrate mainly on the evolution of the script as a whole in its proper cultural context.

I am deeply indebted to those scholars, whether they are referred in the following text or not, who have worked in the field of palaeography. Their studies served for me as a valuable background. The choice of a historical study of the Brāhmī script, no doubt, came with the publication of *The History and Palaeography of Mauryan Brāhmī Script* (1960) by C.S. Upasak; but, of the recent studies on the subject, I have derived much benefit from the *Indian Palaeography* (1963) by A.H. Dani. I have also derived much inspiration from *A Study of Writing* (1963, second edition) by I.J. Gelb.

A word about the Śaka era. We have accepted the current general belief that this era was started by Kanishka in A.D. 78 as a working hypothesis. However, we are aware of the difficulties in accepting this theory but believe that on palaeographic grounds there can not be a vast difference in the date of Kanishka; even if we do not accept him to be the originator of that era.

I am very much thankful to Dr. J.N. Tiwari, Dr. Nisar Ahmad, Sri R.S. Mishra, Sri Lalita Mishra, Sri Suresh Chandra Ghildiyal for their help in preparation and printing of this work in many ways. I am under heavy debt of gratitude to my guru Prof. A.K. Narain, who helped me in the selection of this topic for research and very generously guided me; and, it is to his valuable suggestions that the present form of the book is due.

I must express my gratitude to Prof. A.L. Basham, of Australian National University, Canberra, who not only very kindly had gone through the type-script and gave many valuable suggestions and criticisms but also graciously agreed to introduce my work to the world of scholars. My thanks are due to the authorities and workers of the Eureka Printing Works Pvt. Ltd., Varanasi, especially to Sri Amar Nath Dutt, whose close co-operation I always received.

Brāhmī is the earliest known script of India which has been deciphered and read, and the earliest known specimen of this script does not date before the time of the Mauryan emperor Aśoka.¹ Further, as we shall presently see, in its earliest specimens, Brāhmī does not give the impression of having had a long history or having passed through many stages of development. This being so, and considering that we propose to trace the history of this script from as early as the late 3rd century B. C., we feel it would not be out of place to make a few observations on the origin of the Brāhmī script in India along with a brief review of Aśokan Brāhmī. Scholars in this field so far have mostly confined themselves to the evaluation of references to writing in ancient Indian literature or to negative evidences not very dissimilar in nature or to trace its ancestry from any known earlier script of the world. The problem has rarely been touched at its core. Such significant questions as why, how, in what quarters the need for a script such as Brāhmī was felt in India were never raised or answered. It is only through answers to such queries—through ascertaining the historical process of origin and development and examining the underlying principles—that we may hope to throw real light on the subject.

CHAPTER I

THE BACKGROUND

1. Cf. Upasak, C.S., *HPMB*, p. 192; and Dani, A. H., *IP*, p. 31.

Writing is an item of culture and has its origin and history in a particular cultural context. Many cultures, at one or the other stage of their development, started using the device of recording their language. But the use of writing may not necessarily be the invention of a people themselves. Sometimes existing writing systems are adopted by a people to write their language and sometimes the knowledge of the existence of such a useful device inspires a people to create a new script for their speech.

In modern times, I. J. Gelb has made the most thorough and serious study of the origin and nature of writing and the general principles of its developments.¹ By a minute analysis of the scripts of the world—ancient as well as modern—Gelb came to the conclusion that all scripts follow a certain unidirectional line of development. From origin to full evolution, a script has to pass through such necessary stages as logography, syllabography and alphabetography.² Whether a script is a people's own invention or borrowed, no stage of development can be skipped; that is to say that although in some cases the development may stop after a certain stage, 'no writing can start with a syllabic or alphabetic stage unless it is borrowed, directly or indirectly, from a system which has gone through all the previous stages.' Similarly, on the other hand, 'there can be no reverse development,' i. e. 'an alphabet cannot develop into a syllabary, just as a syllabary cannot lead to the creation of logography.'

Gelb has not found it necessary to minutely test his principle of unidirectional development against the Brāhmī script, but under the rigours of the same rule, he remarks, 'for that reason, it is absurd to speak of the development of Ethiopic (or Sanskrit) syllabaries from a Semitic alphabet,' and therefore, in his opinion, 'both the Ethiopic and Sanskrit writings are further developments from a Semitic syllabary, which, in

1. Gelb, I. J., *A Study of Writing*, Chicago, 1962 (2nd Ed.,).

2. *Ibid*, p. 201.

turn, is a creation following the model of the Egyptian syllabary'.¹ Gelb, of course, is conscious of the difficulty of describing Brāhmī script as alphabetic or syllabic; for instance the consonant sign *ka* of Brāhmī (combined as it is with the vowel sound *a*) cannot be called an alphabetic sign, and still it could hardly be called syllabic. But it appears that he postulates the Semitic contribution to Brāhmī mainly to explain the almost complete absence of the earlier stages of this script.

Elsewhere, however, Gelb has taken a different stand on this problem. While dealing with the origin of Semitic writing, he considers six possibilities in the writings of the world outside the Semitic group. The sixth, with which we are concerned here, runs : 'The forms are freely invented with new values as found in a large number of writings such as Balti, Brāhmī... etc.'² In this context, he also notes his disapproval of the various theories of borrowings based on superficial similarities. In his words, 'such formal resemblances between Semitic and other writings as have been brought out by various scholars can be due to nothing but accident.' The majority of scholars who have worked on the problem of the origin of Brāhmī from Bühler to David Diringer and even including Dani, had utilized such resemblances to arrive at 'fallacious results.' Recent researches and experiments have shown the futility of such attempts.³

It is clear from the above that while Gelb does not appear to subscribe to the monogenesis of all the scripts of the world in the usual sense,⁴ he is also not completely free from it. Only, instead of looking to the Semitic alphabet for 'Sanskrit writings', or 'Sanskrit syllabary', he goes still further back to find its inspiration in the Semitic syllabary. This is a hypothesis for which he supplies no convincing argument, except probably

1. Gelb, *op. cit.*, p. 201.

2. *Ibid*, p. 144.

3. *Ibid*, pp. 144-45.

4. *Ibid*, pp. 217-18.

the necessity of the principle of the unidirectional development discovered by him.

We feel that the problem can be looked at also from another point of view. A script can be created by an intelligent and culturally advanced people simply by the knowledge of the existence of a system of writing. Our contention is that, on this hypothesis, all the difficulties about the origin of Brāhmī script may be resolved. Further, we may also note that this pre-existing inspiring script need not have been the Semitic one, not only for the reason that Brāhmī is not derivable from any Semitic script but also because the possibility of a pre-Brāhmī script in India cannot be ruled out, at least on theoretical grounds.

On the problem of the origin of Brāhmī in particular, one has to consider the principles of 'inner development' and of 'outer development'.¹ The principle of inner development concerns mainly the phonetic value attached to the particular sign of a script. Phonetic value given to the sign also changes or evolves in the same way as the outer form of the letters evolves. But the principle of inner development is true mainly in the case of the development of the alphabet. In the case of *varṇamālā*, we find it fully developed long before the use of Brāhmī script;² by the time of Yāska it was perfected.

Once we take the above fact into consideration, we will not have to look very far for the origin of Brāhmī script, because a fully developed *varṇamālā* is there and at least the knowledge of the existence of writing can be presumed. We will not indulge here in discussion about this pre-existing writing, for that is immaterial here. The only thing needed for the people was to create a new script with the help of simple geometrical forms of straight lines, triangles, squares and circles etc. which can be easily learnt and remembered by the users of the system.

1. Gelb, *op. cit.*, pp. 251-52. I owe these terms to Gelb.

2. L. Sarup, *An Introduction to Nirukta*, p. 55.

As put by Gelb, any formal resemblance can be due to nothing but accident, if it is not associated with the same phonetic value and on that account it is fallacious to derive the origin of one from the other. Most of the scholars who have worked on the origin of Brāhmī script did not take this fact into consideration. They failed to take into account that a script has got two elements, namely, (i) the formal (visual) element and, (ii) the phonetic element. They also failed to recognize that there is a fundamental difference between the evolution of Brāhmī and the evolution of the alphabet of the West.¹ In India, the script follows *varṇamālā* while in the West the alphabet followed the script, which is evidenced by the changes in the alphabet at many stages of its development.²

To the question why a fully developed *varṇamālā* of 64 or 63 letters³ was partially adapted to a script having 45 signs only our answer is that perhaps the newly created script was mainly for the purpose of writing the Prākṛit languages having many less sounds than the Sanskrit. This needs elaboration.

The sixth century B.C. has been described as 'an age of far-reaching religious reforming activity over the whole of the ancient world.'⁴ Just as in Greece, China and Iran, so also in India, this period witnessed a remarkable cultural movement, embracing every aspect of life—social, political, economic, religious etc.⁵ By this period in India, the tribal organisation of the society has given place to territorial units and a large

-
1. We have no inclination to call Brāhmī *varṇamālā* an alphabet and it should be mentioned here that it is not true that the alphabet of the West is the final development of phonetic researches in the sphere of writing.

number of *Janapadas* had come into being, vying with each other for supremacy.¹ Growth of towns and development of trade and commerce is another distinct feature of this age.² Probably money was invented during this period.³ In the field of religion and philosophy, the age is still more noteworthy.⁴ There was a very marked tendency towards doubt and dissent and free speculation. We have a mushroom growth of ascetic teachers in eastern India, all preaching anti-vedic ways of life. The vedic brahmanical tradition receives a definite set-back and in its attempt to survive it is gradually transformed.⁵ In addition, many popular religions appeared which were later to change the colour of the religious history of India.⁶ Further, the thought of this period exhibits this remarkable feature that it is addressed not to a select minority, but to all without any distinction of caste or sex.⁷ All these developments were not mutually exclusive but part of a common cultural movement in India.⁸ The changes in social life appear to go hand-in-hand with those in the realm of thinking. The social changes probably created an 'occasion' for fresh thinking and new doctrines facilitated and justified changes in social life. The evidence, on the whole, is overwhelming that here we are unmistakably in an age of a general awakening of the common people.⁹ This had far-reaching impacts on the

9. Hirianna, M., *op. cit.*, p. 88.

social, religious, artistic, literary and linguistic history of India. We are mainly concerned here with growth in the prestige and popularity of the languages of the common people. It is a well-known fact that the *parivrājaka* teachers of eastern India during this period chose local dialects for their instructions,¹ interested as they were in bringing philosophy into the open and proclaiming it far and wide. And here, the most significant contribution is that of Gautama the Buddha. Buddha not only adopted the spoken language of his region for his sermons but emphatically denied their preservation in any sacred language, and freely gave his consent to learn them in one's own own tongue.² It is thus possible to imagine that the Prākṛit languages directly received a great impetus as a result of the cultural movement of the 6th century B. C. in general and of the attitude of the *parivrājaka* teachers like Buddha in particular. Prākṛit languages thus became vehicles of sacred truths of religions and got an honoured place in literature, and they gradually spread throughout the nation and even beyond it.

Sanskrit was the language of the higher strata of the Aryan society and the elaborate and complicated Vedic religion was the monopoly of the privileged few, who possessed a highly evolved language, difficult for the bulk of the society even to pronounce. This privileged class had a full fledged *varṇamālā* of 64 letters and most probably had some complicated script also of which no positive evidence remains.³ In ancient times, long before the invention of printing, the art of writing was not so popular. Only a few societies possessed the knowledge of writing and even in these societies a very limited number of people must

-

 3. Cf. *Mudrārākshasa*, Act I, Srotriyāksharāṇi prayatnalikhitānyapi niyatamasphutāni bhavanti.

have known it. This gave immense importance to the art of writing. Now it can be imagined that if such an art falls into the hands of an exclusive monopolist group, who can order to cut the tongue and fill molten lead into the ears of those who recite or hear the sacred texts undeserved,¹ there is no hope of the knowledge being imparted to the common people. No wonder, if under the influence of a strong cultural movement as outlined above, a script, simple and precise, was created for the use of the popular language which had much fewer sounds than the Sanskrit.

Brāhmī has its own history of development which can be compared with a tree growing numerous branches. As it is possible to trace forward the history of Brāhmī, so also it is possible to trace back its history from almost any stage. In the process of tracing back the history of Brāhmī, when one reaches the second-third century B. C., one feels that he is not far from the original source from which the Brāhmī was derived.² The simple primitive angular form of Aśokan script shows that it was not long before that this script was invented. The credit of its propagation, throughout the length and breadth of the country, goes to the missionary enthusiasm of Aśoka. For his edicts he selected a single medium—stone, a standard script,³ and a definite mode of expression. All this was imperial, inspired by the king himself, and, had a uniformity throughout the empire. Thus Aśoka gave the country a standard script to start with. And here begins the real history of Indian palaeography.

We are now in a position to review the nature of Brāhmī script in the period of Aśoka.

The Script of Aśoka

In Aśokan edicts only seven vowels (*a, ā, i, e, u, o* and

-
1. *Gautama*, 12.4 : quoted in *The History of Dharmaśāstra*, Vol. II, Pt. I, P. 155.
 2. Verma, T. P., *op. cit.*, p. 360.
 3. Upasak, C. S., *HPMB*, p. 193.

am) including nasal, and 33 consonants including semi-vowels, sibilants and spirant are used. Long vowels *ī, ū, ai, au* are avoided but the medial signs for *ā, i, ī, u, ū, e, ai, o* and *anusvāra* are used. Among the consonants only guttural nasal *ṇa* is not used.

Almost every letter has a cursive variety but the standard form remains the same. One can notice the germs of subsequent developments in these varieties, which we will discuss in the proper place. Reverse forms of some of the letters are also found. Reverse *o* – 𑀭 – in RE Dhauli and RE Jaugada,¹ and *dha* – 𑀭 – at Dhauli, Jaugada in SRE, at Delhi-Topra on PE and at Rupnath, Maski, Erraguḍi and Gujjar in MREs² have been noticed. But this reverse variety of *o* is not found in later inscriptions, though the reverse type of *dha* becomes a characteristic of the later period. One may notice very peculiar shapes of many letters but all these cannot be regarded as separate varieties. These peculiarities can be attributed to the individual habits and mannerisms of the writer and, to some extent, also of the engravers.

The Aśokan inscriptions are well written. Stone was selected as a suitable medium, for it survives longer.³ Inscriptions on pillars with smooth and highly polished surface were engraved after polishing, but for the inscriptions on rock—quartzite, trap, granite etc.—no attempt at the preparation of the surface was made. As a result the pillar inscriptions are comparatively better written than the rock ones.

The technique of engraving on stone was far advanced during this period. To engrave on the surface of a rock or a pillar, an inscription was first written by the *lipikara* or *dipikara* with the help of a longish piece of charcoal or hematite. It was due to this writing tool that the lines of the letters are

1. Upasak, *op. cit.*, p. 52.; and Dani, *op. cit.*, p. 38.

2. *Ibid*, p. 257 App. XXV(9).

3. Chira-thitike siyā, MRE, Rūpnāth, 1.4.

uniform in breadth. Dani¹ observes that 'this device can not result in the formation of the so-called 'serifs' on the top of the verticals'. He further opines that 'Bühler was mistaken in detecting these marks in Aśokan Brāhmī'.² After the primary writing there followed the task of the cutter, who engraved every letter carefully and faithfully. Presumably he was an illiterate man, judged by the way he blindly follows the lines of the writer, and therefore he should not be expected to follow the writer's pen strokes. He takes liberty in chiselling the letters, that is to say he feels free to cut a certain part of a letter first and the other next, irrespective of the movement of the writer's hand. For example, while cutting *ya* the chiseller could begin with  or , and then add the second hook as  or .³ This is most important from the view point of the palaeographer, whose main job is to determine the trend of the writing. And it was not the chiseller who was responsible for the formation of the letters. In Aśokan inscriptions his part was a secondary one. The writer was mainly responsible for the shape and the style of the letters. Unfortunately we are not in an advantageous position on this point, and therefore faithful reproduction of the letters and their classification into varieties on this ground can not bear much fruit. Dani is right when he says that, 'the most important point is to find the manner in which the letters were actually formed; once we discover this the shapes emerge of themselves'.⁴

Transition towards popularity : late 3rd century B.C.

After the death of Aśoka his style was continued to some extent by his grandson Devanampiya Dasaratha in Nagarjuni cave inscriptions.⁵ These are three in number but identical in content except for the name of the caves. Here

the verticals of the letters are strikingly reduced and a thickening tendency is also noticed in some of the letters.¹ Slanting form of *ja* and straight line horizontal medial for *o* are some traits, which can be judged to indicate ultra-modern tendencies in these inscriptions, and some of them are accepted as current in subsequent period.

In these inscriptions the dental *sa* always is written like a retroflex *sha*, a phenomenon which has been observed in the Mahasthan inscription also. We venture to suggest that this can be taken as a style of the region. In Nagarjuni cave inscriptions the dental *sa* has been written like retroflex *sha*, but it is wrong to suggest that it is always replaced with retroflex *sha*.² Dani³ points out that had it been intended to be *shū* the medial *ū* should have been attached to the second curve but it is to the main curve- & - and therefore it should be read as *sū*. Similarly in Mahasthan also the medial *u* of *su* is attached to the main curve.⁴ Here it can be pointed out that from the 5th century onwards the copper plate inscriptions of Bengal mostly dropped the form of *sha* and used only dental *sa*.⁵ The general appearance of the script of the Mahasthan record is similar to that of Aśoka. Its nature also suggests that it is some official record. D. R. Bhandarkar believes it to be issued by some 'prince of Mauryan dynasty'.⁶ If any conclusion can be drawn from the similarity of the use of *sha* in these two sets of inscriptions, this prince can be suggested to be Daśaratha. Barua traces its association with the Sohgaura inscription,⁷ on the basis of similarity of the contents of both the records. The Sohgaura inscription is on a piece of cast bronze measuring $2\frac{1}{2}'' \times 1\frac{7}{8}'' \times \frac{1}{16}''$ weighing $5\frac{2}{5}$ tolas and, not on a piece of copper as generally

FIG. 1 Sohgaura Copperplate.

Sohgaura Bronze Plaque Inscription

believed.¹

Since 1894 several scholars have expressed their views on this epigraph.²

In 1952, Sircar³ examined the original record, which is the property of the Asiatic Society, and found to his surprise that 'the reading of the inscription preferred by scholars who did not examine the original contains several mistakes'.

He now concedes 'that his own

1. Sircar, D. C., Sohgaura Bronze Plaque Inscription, *JASL*, XVII, No. 1, 1952, p. 1.
2. Hoey, Smith, Hoernle, Bühler, Barua, Jayaswal, Chakravarty etc. have devoted very little space to the palaeography of this inscription. They have mainly concentrated on other points dealing with the age of it and referred to its palaeography very casually. Sircar and Upasak have dealt with the palaeography of individual letters to a greater extent.
3. Sircar, D. C., *op. cit.*, p. 1.

transcript and interpretation of the record, having been based not on the original but on its representations, are not free from errors'. Here it will not be out of place to mention that this is one of the major difficulties in the way of the students working on Indian palaeography. It is not practicable to examine each and every record in the original and therefore one has to depend on their photographic representations. But even these photographic representations are not always very dependable. They are sometimes adjusted and retouched to suit some particular point of view or reading. We have two such photographs of the inscription under discussion. One photograph is reproduced from the *JRASBL*, III, 1937, *Numismatic Supplement*, (Silver Jubilee Number) Pl. 7, Fig. 1, entitled 'Sohgaura Copperplate', which will be referred to as *NS* photograph. The second one is from *JASL*, XVIII, 1952, pl. I¹ entitled 'Sohgaura Bronze Plaque Inscription' by D. C. Sircar. A comparison of these two photographs reveals startling differences in the formation of individual letters. We propose to point out some of them as follows :

1. *Line I, 2nd letter* : There is a marked difference in the formation of the letter *va* in the two photographs.

2. *Line II, 2nd letter* : The *i* medial attached to the letter *sa* gives two different formations. In the *NS* photograph the upper end of the medial turns to the left, which is very significant from the viewpoint of palaeography. But in the *JASL* photograph there is no indication of any such stroke.

3. *Line II, 6th letter* : This letter looks something like *pa* in *NS* photograph. In Sircar's plate it has an appearance which can be read as *va*. Bühler and Sircar etc. read this letter as *va* while Fleet and others preferred to read it as *u*.

-
1. Here it is to be mentioned that while the journal is dated 1952 the plate bears a different date. It is entitled as *JASL*, XVII, pl. I. To avoid any possible confusion we will refer to this plate with reference to the date given on the Journal and not on the plate.

4. *Line II, 13th letter* : In the *NS* photograph there is no indication whatsoever that this letter has any *u* medial sign while in the other photograph there is a suspicious suggestion of it.¹

5. *Line II, 18th letter* : This letter *la* has no *ā* medial sign in the *JASL* photograph but in the other there is a clear *ā* medial.

6. *Line III, 2nd letter* : This letter has been variously read as *ya* and *gha* by Fleet² and Bühler³ respectively. In the *NS* photograph it looks like *ya* and in the *JASL* photograph it is more like *gha*. Such differences are misleading.

7. *Line IV, last letter* : The letter is *ya*. Some scholars read an *o* medial sign attached to it and some do not recognize any such medial sign. Here both readings can be confirmed through the photographs. In *NS* copy it is *yo* while in *JASL* copy there is no such indication.

Such instances can be multiplied, and at least thirty percent of the letters appear to have been retouched unjustly. In our opinion Sircar's representation is nearest to the original one. For our table we have taken the help of this photograph.

By nature this epigraph is unique one. It is cast in a mould, believed to be 'a sand-mould of imperfect smoothness' or 'a hard or fairly hard mould'. It was rightly observed that this explains the unevenness of its surface and the meaningless dots that stand between the letters which may be taken for *anusvāras*. The reverse formation of the first letter of the second line and typical *i* medial attached to the letter *ha* of the fourth line may be explained as casting errors, though the latter error may be of some significance as we come across a similar formation in

1. *JASL*, XVIII, p. 2.

2. *JRAS*, 1907, p. 522.

3. *IA*, XXV, 1896, p. 262.

the first letter of the Barli inscription.¹ This point will be considered in detail later.² Two similar cases of *ga* versus *ta* may also be casting mistakes though there is the possibility of their being linguistic usages. The first occurs in the first line which has been read by Sircar as *mahamaga-(ta)na* and the second in the last line read as *gahlga(ta)vaya*.³ There can be no confusion about the first *ga* which is clearly a *ga* but the formation of the second one may be doubted.

The Piprahva vase inscription has a different story. For its association with the Mauryas we have no ground other than the flimsy and fickle one of palaeography. For palaeographic studies here we are in an advantageous position for several reasons.

This short inscription is scratched (not engraved) on a spherical casket of sandstone, probably with some pointed stylus. Palaeographically it can be noticed that there are three main factors which influence the formation of the letters in this epigraph and make them look more archaic than they are: (i) scratching done on a hard material like sandstone (ii) the spherical shape of the casket, (iii) the use of a pointed stylus or tool for writing.

The hardness of the stone made scratching very difficult, and sometimes affected the formation of the letters. For example, the middle vertical of the letter *ya* of *iyam* is not a straight line but curved; similar is the case with the letter *te* of *bhagavate*. Such curved lines are, most probably, due to the hardness of the material. The spherical shape of the casket also influenced the formation of the letters. Engraving on a pot might have involved a risk of damage which was avoided by adopting the method of scratching. The device of scratching on a spherical object tended to make the letters long and slanting.

1. Haldar, R. R., *IA*, 1929, p. 229.

2. *Infra*, p.

3. Sircar, D. C., *SI*, p. 85.

The medial sign for *u* also tends to become somewhat longer. The use of a pointed stylus sometimes made repeated scratches necessary, which resulted in some additional and unwanted strokes. Such additional lines can be observed in the photograph,¹ in the letters *na* of *bhatina* and *ni* of the word *sabhaginika* etc. But one of the obvious advantages of this scratching, for our purposes, is that we can observe the movement of the hand of the writer in the process of writing, which is otherwise difficult to notice in engraving. The movement of the hand determines the course of the development of the script.

The inscriptions from the Ramgarh hill caves are private in nature but have close affinity with the administrative record of Mahasthan because of the use of the *danda* as a punctuation mark and the use of the retroflex *sha* in place of *sa*. There are two inscriptions in two separate caves on the western slope of the Ramgarh hill.² The northern cave is called Sitabenga and the southern one Jogimara. The Sitabenga inscription is engraved in two lines of thin but almost equal sized letters, while the Jogimara one spreads over five lines with letters of unequal size. It seems that the scribe of the Jogimara cave inscription was a literate man and he tried to incise the record on the surface of the rock without writing it first with chalk or similar material. This is evidenced by the two lines engraved in small letters above the three line inscription, the contents of which are the same as the first line of the lower record. Upasak rightly observes that 'perhaps finding the letters too small or the smooth surface insufficient, he gave it up and restarted the whole text once again in bold letters...'³ It is possible that he could not estimate the space to be occupied by the text without a preparatory writing. The other evidence of this unprepared engraving is the size of the letters; letter *da* and the conjunct *kyi* of the third line are of unusually large size while the letters *ka* and *na* etc. of the same line are the

-

 2. Bloch, T., *ASI (AR)*, 1903-4, pp. 123 ff.
 3. Upasak, *op. cit.*, p. 183.

smallest. The conjunct *kṛi*, for want of smoothed space, is engraved slightly below the line consequently appearing to be in the subsequent line. Also the lines are not straight.

Though the dialect of the Jogimara cave is Magadhi and that of the Sitabenga is Lena-Prakrit, both the inscriptions are contemporary.

All these inscriptions can be ascribed to the close of the third century B. C. which marks a transitional period. During this period, Brāhmī freed itself from the stereo typed formula of Aśoka's imperial mode of expression and tended towards popularity. After the death of Aśoka, disintegrating trends started functioning and regional cultural diversities, suppressed under Mauryan imperialism, were let loose. Because the successors of the Mauryas failed to keep the whole country under a single political canopy and because foreign invaders became more active on the north-western frontier of India smaller kingdoms sprang and more intimate cultural contacts with the western world became inevitable. The former factor divided India into many sub-cultural units and the latter made some units more adoptive and progressive than the others in remote areas. The centre of cultural gravitation shifted from Magadha in the east to Mathura in the west and innovations and inventions were accepted in the west more readily than in the eastern and other parts of the country.

The Age of Experiments : 2nd century B. C.

For the first time writing appeared on the coins in this period. The old technique of punching was discarded and modern techniques of incuse-stamping, as in the Negama coins from Taxila, die-striking and casting were adopted. Second century B. C. is marked by such experiments in transition and incuse-stamped Negama coins, cast square *kāḍa* coins and the coins of the early Yaudheyas, Erakanya coins, reverse-legend coin of Dharmapala which are either die-struck or cast can be

attributed to this century. Sometimes these coins are attributed to the early third or even the fourth century B.C. which does not seem justifiable in the face of the fact that the Mauryas were ruling during this period and that they used the knowledge of writing very extensively. The new techniques of coinage can be attributed to Greek influence. The Besnagar pillar inscription of the ambassador Heliodorus from the court of the Indo-Greek king Antialikidas to the king Bhagabhadra in Malwa, also belongs to this period and provides valuable insight into the prevailing mode of writing which was soon to be accepted as current in this region. The inscriptions of this period form the subject matter of the third chapter.

The Period of Diffusion : 1st century B. C.

The first century B. C. is marked by the movement towards the popularisation of the art of writing. Though the Ghosundi and Bhilasa inscriptions are associated with royal names their theme is popular, that is to say, religious. The legends on the tribal and local coins of the Yaudheyas, the Arjunāyanas, and the earlier issues of Kausambi, Kanauja etc. are also evidence of this movement. The Barli inscription can also be placed in this period on the grounds of palaeography. The construction of the great stupas at Sanchi and Bharhut was in progress and the enthusiastic *upāsakas* (householders) as well as *bhikkhus* took an active part and gave donations. Beside their religious zeal the temptation of having their names engraved on the stone railings etc. contributed much towards the completion of these stupas. There is little doubt that this was a great step towards the popularisation of the art of writing. The early inscriptions of Sanchi and Bharhut belong to this period along with the coins of series II. This will form the subject matter of the fourth chapter.

A New Pen Style : early 1st century A. D.

The increasing popularity of writing introduced individual and personal elements in the script which consequently gave rise

to local styles. New techniques and personal interests evolved new styles in writing and by the time the Christian era started some new elements were introduced, most probably under foreigners—the Saka Kshatrapas of Mathura. With the introduction of the edged reed pen, letters took a new face.¹ Since the time of Aśoka some simple tool had been used which gave the lines of the letters uniform breadth and through this device the so-called 'serif' on the top of the verticals could not be produced in Aśokan inscriptions. Dani notices the mistake of Bühler in depicting these marks in Aśokan Brāhmi.² But with the introduction of this new tool, a new style of writing emerged with consequent simplification or elaboration of shapes. From this, also taking into account individual mannerisms, common to a large group of writers in a given area, regional schools emerge. The diffusion of the knowledge of writing and the degree of the practice with this new tool differentiated one school from the other. The new tool contributed in the formation of the heads at the top of the letters which were the natural outcome of handling it in a skilled way. It also resulted in beautifully curved flourish in the formation of the medial *i*. Dani observes that in some places this technique was properly known and used, in backward regions it was only copied in a crude fashion. In the latter case the head formation appears like a dot or a sign as in Nanaghata and Arikamedu.³ In this period the centre of gravity of cultural activities shifted to Mathura which became a great centre and remained as such under the Kushanas for three centuries after which the centre of gravity again shifted to the east under the Imperial Guptas. In the field of palaeography also the Mathura school developed great importance during the first three centuries of the Christian era.

For the convenience of study the first century has been divided into two sections. During the first half the process of

1. Dani, *op. cit.*, p. 52.

2. *Ibid*, p. 32.

3. *Ibid*, p. 53.

the diffusion of the knowledge of writing continues and as a result of foreign contacts, the influence of the Greek palaeography and the new tool, a revolutionary change can be noticed in the inscriptions of the Kshatrapas of Mathura, and of Sanchi Series III and of the coins Series III. In the eastern region also in the inscriptions of Bharhut, the Bodhgaya railings, Pabhosa and Ayodhya this can be marked. These are dealt with in the fourth chapter.

Under the Influence of the Great Kushanas

With the advent of the Kanishka group of the Kushanas, the Mathura style of writing changed rapidly. By now several regional styles can be noticed at different centres like Mathura, Sanchi, Kausambi, Sahet-Mahet etc. That the art of writing had become very popular is clear from the fact that except for a very small number all the inscriptions of this period are by private individuals. The new pen and individual mannerisms gave new face to some letters in certain regions, which became in due course the marked style of the locality. Most of the inscriptions are dated in an era starting from the advent of Kanishka which is generally equated with the Saka era beginning from 78 A. D. There are, however, many undated inscriptions, but it is not difficult to assign them to a definite period and locality even on grounds other than palaeography. From the viewpoint of style, these inscriptions are classified and arranged into two groups. The 'Western style' includes the inscriptions from Sanchi and Mathura region, while in the 'Eastern style' inscriptions from Sarnath, Sahet-Mahet, Kausambi and Bandhogarh area are included. In the 'Eastern style' are also included Mathura inscriptions of Kanishka of the years 4 and 14, and also that of

Huvishka of the year 33, because of the peculiar formations of letters *sa*, *ma*, *ha*, *la*, etc. occurring in them. A detailed discussion of these may be seen in the sixth chapter.

Gelb defines epigraphy and palaeography in the following words :

‘The investigation of writing from the formal point of view is the prime domain of the epigrapher and the palaeographer. These terms are frequently interchangeable, but in good usage the two should be carefully distinguished. The epigrapher is interested chiefly in inscriptions incised with a sharp tool on hard material, such as stone, wood, metal, clay, etc., while the palaeographer studies mainly manuscripts on skin, papyrus, or paper, written in drawn or painted characters. Generally speaking, epigraphy treats of older writings; while palaeography is concerned with manuscripts from younger periods.’¹

This definition, however, is not in accordance with the established traditions of Indian epigraphical studies of more than a century. An Indologist, whether Indian or foreigner, always takes palaeography as that branch of knowledge which deals with the formal development of individual letter signs. We too have followed this definition with one significant difference. While the old palaeographers mainly devoted themselves to answer questions like *what?* *when?* and *where?*, we have tried to confine ourselves to *why?* and, above all, *how?* These are the questions of paramount importance in establishing the theoretical back-ground of a science like palaeography. Dani took the lead in this direction and we are much indebted to him for his studies.

In our study of palaeography, not much stress is laid on the standard forms of a period; rather, we have selected some forms of letters which explain their connection with

1. *Op. cit.*, p. 22; cf. also David Diringer, *The Alphabet*, p. 18.

corresponding forms of the previous period and also indicate the lines of future development. In this type of study, the so-called 'varieties' do not have much importance, and we regard them as superficial and unnecessary.

Palaeography is not a very firm base to establish a chronological scheme without the risk of endless controversy, and, hence in our opinion its study should be done in context of the previous and future formations of individual letters, and, in terms of the factors which were instrumental in such developments.

The inscriptions of Aśoka had a unity of purpose and singularity of inspiration, consequently establishing a standard for the Brāhmī script throughout his vast empire. The script of the time of Aśoka has rightly been called 'imperial' by Dani,¹ having negligible variations which can hardly be regarded as regional or local.² One of the obvious results of his efforts was that the script of the royal proclamations was propagated all over the country and was made accessible to all people without discrimination. This can be regarded as one of his greatest services to the nation. But as far as the evidence has come to us there seems nothing from which one can infer that the art of writing was generally used by the people during his reign. It was during the time of his successors that the script started gaining popularity. Aśoka had a definite mode of expression which was not followed by Dasaratha, but even then the inscriptions of Dasaratha can be called royal, though the efficient hand of the royal *śpikara* is lacking there. The Mahasthan and Sohagaura records are administrative in nature. The former is engraved on the traditional medium-stone while the latter is inscribed by the technique of casting which became a favourite feature for the coins of the

CHAPTER II

THE PERIOD OF TRANSITION

(late 3rd cent. B. C.)

1. *IP*, p. 50.

2. *Ibid*, p. 48; Upasak, C. S., *HPMB*, p. 193.

subsequent period. There are some other records which are individual or even private in nature. The Piprahva vase inscription can be called individual while the Jogimara cave inscription is private. Thus this period is marked with the transition of the script from royalty to popularity.

General Observations

A comparative study of the reproductions of the records will reveal that though the general formation system of the individual letters is almost similar to that of Asoka, the face of the letters differs very much from one record to another. Such differences are mainly due to the differences in the selection of the writing tool and the technique. For example, if it is a stylus, as in Piprahva vase, the letters will be longish, and further, if the medium is spherical, as of the shape of a vase, the letters may be slanting too. On the other hand, if the tool is a piece of chalk or hematite and the medium is stone, the letters may be stunted, as in the Mahasthan record, or longish as in the Jogimara cave inscription. But if the preparatory writing is done in ink on stone with a brush-like tool, the letters may be stunted and of irregular thickness due to the spreading of the ink, sometimes entirely filling the letters. This we can notice in the Nagarjuni hill cave inscriptions of Dasaratha. The writer of these records does not seem to have been very expert and neat in his performance for he did not care to put a dot in the circled to distinguish *tha* from *tha*.¹ We can accept the use of *sha* for *sa* in this record as a regional habit on the basis of its occurrence in the Mahasthan inscription too. The use of ink and a brush-like tool is clear from the letters *va* in *vaḍathikā* (III inscription), and *la* in *Dasalathena* (II inscription) etc., where the letters are filled. Sometimes the writer seems to be in difficulty because of this, e.g., in the letters *bha*, *da*, *a* and *ja* etc.

1. R. P. Chanda and D. C. Sircar read both the letters and Dani even puts a dot in the circle (his Pl. V a, 1) but I could not trace any dot in the circle from the facsimile in *MASI*, No. 1.

The process of casting gives altogether a different face to some letters; for example *ma* has its upper and lower parts detached. The technical problems of scratching letters on wet clay may have led to the unique form of *ma* in this inscription, with upper and lower parts detached. In casting, there are also chances of the letters being reversed, as *da* in line II, and sometimes only a part of a letter is reversed by mistake, e. g., the *i* medial in *hi* in line IV.

Since the inscriptions which can be assigned to this period are few in number and short in contents, it is not unexpected if all the *aksharas* of the *varṇamālā* are not there. Sometimes important varieties of letters, as compared to those of Aśoka, are also wanting.

VOWELS

With the above general observations, we now discuss the types of letters found in this period and ascertain their connections with the corresponding Aśokan forms. Beginning with the vowels we find only three, *a*, *i* and *e* in these records. The letters *a* and *i* are basic and *ā* and *e*, secondary forms. Bühler distinguishes 'eight most important' Aśokan forms of *a* and *ā* merely from their external shape. But Dani recognizes only three main varieties from the point of view of technical formation.¹

In the first series of Dani, 'the vertical is drawn first and the two curves to the left of the vertical subsequently. The varieties originate as the two curves come closer to each other'.² The first variety of this series of *a* is found in the Sohgaure plaque and the Ramgarh hill cave inscriptions (III. 1. i and V. 1. i-ii)³ where the two arms meet the vertical at two different

1. *IP*, p. 36.

2. *Ibid.*

3. Refers to the plates at the end. First Roman numeral is column number, second Arabic numeral is for the line number and third small Roman number refers to the subdivisions of a column. The numbering of the columns is continued through the plates.

points, leaving a gap. But in the Mahasthan record both arms meet at a point (II. l. i). In all these varieties the arms are curved.

In the second series of Dani's *a* 'the curves on the left are replaced by straight lines which make an acute angle. They are drawn first and then the vertical is made. Sometimes the vertical is bent to touch the apex of the angle or a short bar is drawn to join the apex with the vertical'.¹ The Nagarjuni cave *as* are of this type. There we have a variety where a short bar is drawn to join the apex (I. l. i) and in another variety the vertical is slightly bent to meet the apex (I. l. ii). In this record, most examples of this letter are of the second type. The *ā* medial is always placed in the middle.

The vowel *i* is used only in the Piprahva vase inscription where the third dot is placed above the two dots making the apex at the top. This form of *i* appears in REG, PEDT, MRE Sarnath, MRE Erragudi and the cave inscriptions of Barabar hill.² Upasak observes that these forms are probably due to slovenliness on the part of the engraver.³ But we cannot agree with this remark in this case because the Piprahva vase inscription is a scratching and therefore an example of writing at first hand. Furthermore, if we agree with the observation that the Aśokan inscriptions were first written on stone and then the chiseller started his work, there is little chance of such a mistake. This can happen only when a copy of the text is given to the engraver and he is asked to copy it down directly on the stone. Such is not the case with the Aśokan inscriptions. In our opinion, the position of the dots was entirely dependent on the habit of the writer and no definite rule can be formulated about it, according to which we can judge that one form is correct and the other incorrect.

1. Dani, *op. cit.*, p. 36.

2. Upasak, C. S., *HPMB*, p. 48.

3. *Ibid.*

The letter *e* occurs in the Mahasthan, the Sohgaura and the Ramgarh cave inscriptions. It is supposed to have been formed by joining the three dots of *i*, placed trianglewise, by lines.¹ In Aśokan inscriptions, this letter is found with its apex at the top, left and very rarely even at the bottom,² but in the standard form the apex is at the right.³ In the Sohgaura and the Ramgarh hill records, the apex is found to the right but in the Mahasthan it is at the top in all cases, a tendency of later period. The position of the apex generally depends on the habit and convenience of the writer.

CONSONANTS

SIMPLE AKSHARAS

Gutturals

The letter *Ka* maintains its Aśokan form of a simple cross, but the vertical line is now longer than the horizontal one. This tendency can be marked in all the inscriptions assigned to this period except the Nagarjuni cave one. But in the Piprahva vase inscription, the vertical of this letter is unusually longer and slanting. The reason for this has already been discussed in the previous chapter. The medial sign for *ā* is a short bar to the right of the letter at the top. In the Piprahva vase, we come across an *i* medial attached to this letter which is formed by adding a short vertical to the *ā* medial, pointing upwards, thus making an angle (IV. 4. ii-iii). For medial *u*, a simple bar is added at the bottom of the letter pointing to the right (I. 4. ii), which is an Aśokan practice. But sometimes the bar is added slightly above the bottom point as in the Ramgarh hill cave inscription (V. 4. iii). This practice is not found in the Aśokan inscriptions⁴ but we find such an example

1. Dani, *op. cit.*, p. 37; and Upasak, *op. cit.*, p. 49.

2. Dani, *op. cit.*, p. 37.

3. Upasak, *op. cit.*, p. 49.

4. Dani and Upasak do not illustrate this form of *u* medial to *Ka* in the Aśokan inscriptions.

again in the Bodh-Gaya railing inscriptions which we will discuss in the fifth chapter. In Aśokan script, the medial *e* is shown by a short bar added to the top of the letter. This is followed in the Mahasthan inscription (II. 4. ii). In adding *o* medial also, the Aśokan practice is followed in the Mahasthan inscription, i. e., an *e* medial is attached at the top and then an *ā* medial is added to the right a little below it (II. 4. iii). In the Sohgaura plaque, however, this is reversed, i. e., *ā* medial comes at the top to the right and *e* medial is a little below to the left (III. 4. iii). This may be regarded as a casting error rather than a practice.

During this period we find two types of *khṛ*, with a dot at the bottom of the hook or a circle in place of it, both prevalent in Aśokan script. The first example is met with in the Mahasthan inscription (II. 5. i) and the second one in the Ramgarh cave inscription (V. 5. i). In the Mahasthan example the *i* medial is a cursive one.

The letter *ga* is almost everywhere of the angular variety. In the Nagarjuni cave it seems to have a rounded top but this may be due to the use of a peculiar writing tool. Its *o* medial also seems to be a single horizontal line extending to left and right but both the strokes are clear (I. 6. i.).

The reading of the letter *gha* in the third line of the Sohgaura plaque record is disputed. Fleet,¹ Barua² and Jayaswal³ read it as *ya*. In the NS photograph this letter clearly reads as *ya*. D. C. Sircar also accepted this reading in his *Select Inscriptions*,⁴ but after examining the original record he rejected this and accepted⁵ Bühler's⁶ reading of the letter as *gha*. We also accept this reading and have reproduced this

1. *JRAS*, 1907, p. 522.

2. *IHQ*, X, p. 54.

3. *EI*, XXII, p. 1.

4. P. 85 and fn. 3.

6. *IA*, XXV, 1896, p. 262.

letter from the photograph given by Sircar in *JASL*, which looks like— ୯ —(III. 7. i). This is a standard Aśokan *gha*.¹

Palatals

Among the palatals, *cha*, *chha* and *ja* are met with. The most frequent type of the letter *cha* is of the Aśokan form, having a small semi-circle to the left of a straight vertical line. In one instance, in the Nagarjuni cave records, the vertical is very short (I. 8. i). The *u* medial is shown by extending the vertical downwards (III. 8. ii). The *anusvāra* in this letter is placed near the top to the right and is always shown by a dot.

The last letter of the third line of the Sohagaura plaque has variously been read by Bühler as *chha*² and by Fleet as *va*.³ Sircar first supported Fleet's reading⁴ but in his *JASL* revision, he accepts Bühler's reading as correct.⁵ In the NS photograph, this letter is retouched to make a *va* but in the *JASL* plate it is a circle appended to a vertical line which extends into the circle, tending to bisect it (III. 9. i).

The letter *ja* is written in two ways in the Nagarjuni cave inscriptions. The first formation is something like two semi-circles opening to the right and placed one upon the other (I. 10. i). This is most common in Aśokan Brāhmī. The second variety is a cursive one formed in a single attempt of the pen, making three curves, the middle curve opening to the left (I. 10. ii). It is not possible to accept Upasak's view that this shape emerged owing to the carelessness of the engraver, who, when he 'failed to place the two semi-circles one upon another, joined them by a small curve'.⁶ In our opinion such forms can emerge out of the writer's convenience.

2. *Op. cit.*, p. 262.

3. *Op. cit.*, p. 522.

4. *SI*, p. 85.

5. *JASL*, XVIII, p. 2.

6. Upasak, *op. cit.*, p. 66.

Linguals

Only two linguals have been found used in the inscriptions assigned to this period. *Ṭha* is a perfect circle in which *ā* medial is attached to the right in the form of a small bar (II. 11. i) and the *e* medial is a small bar to the left (I. 11. i).

The letter *ḍa* in Aśokan Brāhmī is represented with a horizontal line with two vertical strokes at either end, the left one pointing downwards and the right pointing upwards. In the Mahasthan record *ḍa* (II. 12. i-ii) is comparatively smaller in size like *ka* and *ga*. In the Nagarjuni cave example this letter shows a cursive hand (I. 12. i).

Dentals

Among the dentals, all the five letters are found in these records. The letter *ta* is written in several ways. In the Piprahva and Ramgarh records, it is formed from a straight line to the middle of which another short stroke is added at an angle to the right pointing downwards. In the Piprahva examples, the main line is always slanting (IV. 13. i-ii) and at one place it is not a straight line (IV. 13. iii). On the contrary, in the Ramgarh records the main line is strikingly perpendicular (V. 13 ii-v). Another variety of this letter is formed by appending an angle just below the vertical- λ -, as in the Mahasthan (II. 13. i-iii), the Sohgaure (III. 13. i-ii) and the Ramgarh hill cave (V. 13, i-vi) records. Another sub-variety is formed when the angle is cursorily drawn into a curve - λ -, which can be found in the Nagarjuni cave (I. 13. i), the Mahasthan (II. 13. iv) and the Sohgaure (III. 13. iii) inscriptions. A peculiar variation of this has been noticed in the Nagarjuni cave records where the left curve of the angle takes one more curve (I. 13. ii). The Aśokan mode of adding medials is followed here. The medial sign for *i* is cursive in some cases, as in the Mahasthan and Sohgaure examples and sometimes it is angular, as in the Piprahva and Ramgarh records.

The letter *tha* is a circle with a dot in the middle. In the inscriptions of Daśaratha in the Nagarjuni caves, the writer seems careless (or helpless due to the tool used for writing ?) about the dot in the circle. In the letter *the* of the word 'Dasalathena', there is an inclining projection inside the circle which may have been intended for a dot (I. 14. i), but in other places there is no dot at all. For example, there is no dot in the letter *thi* of the word *vaḍathikā* of the record of the third cave (I. 14. ii). In this letter the *u* medial is a short line appended to the bottom of the letter (III. 14. i).

The letter *da* is of the round variety (as opposed to the angled one ) made up of a semi-circle, open on the left, with the addition of two short varticals at either end (II. 15. ii and V. 15. i). This could be written in a single movement (I. 15. i and IV. 15. i). Sometimes peculiar shapes also emerge when written hurriedly (I. 15. ii). In the Nagarjuni records this letter is attempted in a single stroke along with medial *i* (I. 15. iii-iv).

There is some dispute among scholars regarding the reading of the letter *da* of the second line in the Sohgaure plaque inscription (III. 15. iii). This has been read by Bühler as *da*¹ which he thinks to be of Kalsi type.² But Sircar disagrees with this view and in his opinion 'it has no resemblance with the Kalsi *da* with rounded back'. On the contrary, he found 'in the original a clear *da* of Bhattiprolu type, that is to say, with the central curve open towards the right instead of the left'.³ He further observes : 'As the other cases of *da* in this record is (*sic*) of the regular form, this reverted (*sic*) form is possibly to be attributed to the defect of the mould wherein the plaque was cast (cf. the forms of the letters in the legend of the coin of Dharmapāla from Eran)'. In our opinion, there is no necessity

1. *IA*, XXV, 1896, p. 262.

2. Cf. Bühler's Chart, *Tafel* II, column III. 1. 20.

3. *JASL*, XVIII, 1952, p. 2.

of equating this form to any other form of *da* in any inscription. If it could be understood to be a mistake in the preparation of the mould in which the plaque was cast, it may as well be assumed that this is a regular type of *da* with its opening towards the left and by mistake or negligence it was reversed. There is no doubt that this epigraph is very carelessly prepared and many cases of careless formation of the individual letters—reversed letters and medials, omissions and later insertions—may be marked. Besides this reversed *da*, we have already noticed a reversed *ko* in which the medial *ā* sign is placed at the top to the right and *e* sign is placed a little below the top to left, like— 𑀓 . The correct form can be obtained by simply reversing it— 𑀔 . The same fault is repeated in the letter no. III. 17. iv too, which also can be reversed to the correct form without any deformation of the letter. In the inscriptions of the following period we find two such examples, letter *so* in the Sanchi series I (IX. 38. V) and the letter *ko* in the Sanchi Series II (X. 7. ii). which are obviously mistakes. An example of reversed medial sign *ī* in the letter *hi* of line four of the Sohgauna plaque has also been noticed and will be discussed later.¹ We can point out one example of later insertion of a letter also. In the first line the last letter is a small sized *ka*, which is possibly a later insertion.

The letter *dha* resembles the Roman capital letter D and is written in two strokes. First a vertical straight line is drawn and then a semi-circle that joins the lower and the upper ends with its curve to the right (IV. 16 i-ii).

The letter *na* is made of two straight lines. A vertical line touches a horizontal one in the middle by its lower end— 𑀕 . Usually both lines are approximately of equal length, but sometimes the vertical is longer than the horizontal one (IV. 17. i & v). In the Piprahva record the vertical does not always touch the horizontal line at a right angle (IV. 17. ii, iv & vi). Very rarely the vertical is shorter than the horizontal line

1. *Infra*, p. 38.

(V. 17. i). In this letter the medial for long \bar{u} is shown by extending the vertical below the horizontal line and adding another stroke to the right end of the horizontal line pointing downwards— 𑀓 (V. 17. iii).

Labials

The letter *pa* is drawn like a fish-hook in which the right vertical is shorter (II. 18. i). But a tendency of equalising the verticals can be marked in some records (I. 18. i & V. 18. i) and this became a feature of the subsequent period. The *u* medial is shown through a short stroke attached to the bottom of the hook¹ (IV. 18. i & II. 18. iii) and the *i* medial is of usual Aśokan type (I. 18. i & II. 18. ii) written hurriedly.

The letter *pha* occurs as a conjunct in the Sitabenga cave inscription of Ramgarh hill which we will discuss later. This letter is formed simply by curving the right arm of the letter *pa* inside, as usual with the Aśokan *pha*.

There is only one type of letter *ba*, which is written like a rectangle (V. 19. i), and the *u* medial to it is the usual appended stroke at the bottom of the letter (IV. 19. i).

The letter *bha* has very often been regarded as one of the key letters for tracing the development of the script because it is very susceptible to change in current writing. In the Aśokan Brahmi this letter is drawn by joining the tops of two short vertical lines by a horizontal one protruding to the right from which another short vertical shoots upwards— 𑀕. This is the most common type of *bha* in the Aśokan inscriptions, and was retained in this period also (IV. 20. ii-iii). But sometimes upper and the lower verticals tend to form a straight line 𑀕 (IV. 20. i & V. 20. i). However, the Sitabenga *bha* in the Ramgarh hill

1. It is strange that Upasak notices *pi* instead of *pu* in the Piprahva vase inscription and illustrates a peculiar *i* medial to it— 𑀓, which turns to the left at the upper end; C. S. Upasak, *op. cit.*, p.176.

inscription (V. 20. i) is somewhat cursive, and was incorrectly read by M. Boyer as *dha*.¹ These are the two main varieties. Other variations are formed by individual mannerisms and personal habits of drawing one part of the letter first and the other afterwards. As we notice in the Nagarjuni caves (I. 20. i-iii), first a rounded *ga*-like formation is drawn and then the upper horizontal line is extended to the right and turned upwards in a single stroke. To add a long \bar{u} medial, first a horizontal bar is added to the right of the lower right vertical making a right angle and then another stroke bisects the angle— π (V. 20. ii). \bar{A} (V. 20. i) and *i* (I. 20. iii) medials are formed in the usual way though the *i* medial is a somewhat cursive one in the latter example.

The letter *ma* is of only one variety, i. e. a complete circle with a crescent upon it (V. 21. i). But in the Sohgaura inscription, the crescent is always detached from the circle (III. 21. i-v). The medial sign for \bar{a} is a short bar added to the right arm of the crescent (II. 21. i) and the medial for *e* is a short bar added to the left arm (III. 21. iii). For the *o* medial short bars are added to both the arms (III. 21. iv).

Semi-Vowels

Dani² observes two basic forms of *ya*, the crescentic one and the segmented one. The crescentic form of *ya* is made by drawing a vertical to the middle of the arc of a circle \downarrow . This we find in the Sohgaura (III. 22. i-iii) and in the Nagarjuni cave (I. 22. i-ii) inscriptions. However, in later records there is a tendency towards shortening the middle vertical and equalising all the arms. This tendency is met with in the Nagarjuni cave inscriptions. There is an angular variety of this basic form which we see in the Ramgarh inscriptions (V. 22. i-vi). This is sometimes called the wedge-shaped

1. *ASI(AR)*, 1903-4, p. 124.

2. Dani, *op. cit.*, p. 42.

variety. The second basic form is drawn by adding two small arcs, on either side of the base of the vertical—  (II. 22. i-iii and IV. 22. i-ii). In the case of the Piprahva vase inscription, the middle vertical of *ya* is not a straight line (IV. 22. ii), but this can be treated as an inaccuracy in the shape of the letter resulting from the different medium. The medial for *ā* (II. 22. ii, III. 22. ii and V. 22. ii), *i* (II. 22. iii, III. 22. iii and V. 22. iii), *e* (V. 22. iv), *o* (V. 22. v) and *am* (V. 22. vi) are in the usual Aśokan fashion.

The letter *ra* is found only in the Ramgarh hill cave inscription and that is of the serpentine vertical type. The medial sign for *ā* is attached at the top of the letter (V. 23. i), while the *u* medial sign is added below not at the tip but a little above it (V. 23. ii).

The letter *la* is also of the usual Aśokan type, in which the left arm is shorter than the right one (II. 24. iii, III. 24. i-iii, IV. 24. i-iii and V. 24. ii-iv) but in some cases a tendency towards equalising the arms is marked (I. 24. i and V. 24. i). The medial sign for *ā*, *u*, *i*, *e* and *am* are in the usual Aśokan style but in some cases of *i* medial a cursive hand is visible (I. 24. i & IV. 24. iii).

The formation of the letter *va* is a simple one, i. e. a complete circle appended to a short vertical line. This letter is found used in all the records of this period selected for study. In the Sohagaura plaque inscription, the sixth letter of the second line is of disputed reading. What Bühler read as *vasa-game*¹ (Sk. *vaṁśagrāme*), Fleet was inclined to read as *usagame*.² In *Select Inscriptions*, Sircar accepted the possibility of both readings.³ But now, after examining the original plaque, he thinks it 'beyond doubt that the first of these four letters must

1. *IA*, XXV, 1896, p. 262.

2. *JRAS*, 1907, p. 522.

3. P. 85.

be read as *va* and cannot be *u*¹ (III. 25. ii). The same form of *va* can also be noticed in the Nagarjuni cave inscription (I. 25. ii). One can see Bühler's chart (Tafel II. IX. 1. 36) for this form of *va*. The simple type of *va* is to be seen in the Nagarjuni cave, Sohgaure, Piprahva, Mahasthan and Ramgarh hill cave inscriptions.

Sibilants and *Ha*

The Jogimara cave inscription at Ramgarh hill is written in the Māgadhi language and, in its exclusive use of *śa*, is more closely connected with the Māgadhi of the grammarians than the Māgadhi of Aśoka.² This type of *śa*, having the additional stroke in the left leg— *Λ* , very rarely appears in the Aśokan inscriptions, e. g., in the REK.³ The medial sign for *i* (V. 26. i) is a cursive one, and the sign for *e* (V. 26. iii) is correctly attached. To make the sign for *u* the right leg of the letter is slightly curved outwards (V. 26. ii) which is a tendency of the later ages.

It is generally believed that in the Nagarjuni cave inscription of Dasaratha 'no dental *sa* is to be seen, as it is always replaced with the retroflex *sha*'.⁴ R. P. Chanda reads only *sha* in these inscriptions,⁵ while D. C. Sircar arbitrarily reads both *sa* and *sha*.⁶ Here it must be noticed that all these letters are of the same formation and they should be read either as *sa* or as *sha*.⁷ In the Mahasthan stone inscription we find both formations (II. 27. i-vi), which in the Aśokan inscriptions could have been read as *sa* as well as *sha*. C. C. Dasgupta observes that this inscription 'shows for the first

1. *JASL*, XVIII, 1952, p. 2.
2. *ASI (AR)*, 1903-4, p. 124.
3. Upasak, *op. cit.*, App. XXXVI (4).
4. Upasak, *op. cit.*, p. 173.

6. *SI*, pp. 79-80.
7. Cf. pl. 1 in *M. ASI*. No. 1.

time that in the Maurya period two forms of Brāhmī *sa* were prevalent—one which looks like the usual Aśokan *sa* and the other like an Aśokan *sha*.¹ We agree with this explanation but with the slight amendment that the inscription should be dated to the late Mauryan period. Though there is a little difference in the formation of these two letters, there is a test from which one can judge which letter it was intended to be. Dani² and Upasak³ both agree, though in different contexts, that if it is meant to be a *sa*, the *u* or *ū* medial should always be added to the primary hook— or , but if it is intended to be a *sha*, the *u* or *ū* medial should be attached to the secondary hook— or .⁴ On this test, the *sha*-like formation must be *sa* for, we notice *su* in the Mahasthan inscription (II. 27. v) and *sū* in the Nagarjuni cave inscription (I. 27. ii) where the *u* and *ū* medials are attached to the primary hook. Thus there can be little doubt that these forms should be read only as *sa* and not *sha* as read by the earlier scholars. As both the records come from the same region, this confusion can be attributed to the peculiarities of regional pronunciation. In the Sohgaure plaque, the secondary hook of *sa* is added in a peculiar way (III. 27. ii-iii) and similarly in the Piprahva vase inscription, the second hook is a downward extension of the vertical (IV. 27. ii).

The letter *ha* is written like a reversed *la*. In some cases the bar at the right arm is at the tip of the vertical (II. 28. i & III. 28. i-ii) but sometimes it is a little below it as in the Sitabenga inscription of the Ramgarh hill, while in the Nagarjuni cave inscription of Dasaratha this horizontal bar is near the bottom of the letter (I. 28. i). In these two inscriptions, a tendency of equalisation of the arms is marked. The medial *i* sign in the

-

 3. Upasak, *op. cit.*, p. 182.
 4. *Ibid*, p. 110.

Mahasthan and the Nagarjuni records is cursive, but in the Sohgaura plaque it is particularly unusual (III. 23. ii). This sign is attached in a reversed manner, opening its curve to the right. Obviously this is a mistake in the preparation of the mould, but it is an interesting coincidence that in the Barli inscription the first letter, usually read as *vī*, also has the *ī* medial curved to the right. There it is read as long *ī* while in the Sohgaura plaque it is read as short *i*. If this reading of the Barli inscription is accepted as correct and if it could be applied to the Sohgaura instance also, the implications of this reading will be far greater. Firstly, then it should be read as *gahitavaya* instead of *gahitavaya*. This reading is nearer to its Sanskrit original *grahitavyam*. Secondly it will mean that in this inscription long vowels are also used, though their apparent absence has been used by the scholars in favour of this inscription being earlier. But such conjectures are hardly sound, as the reading of the first letter of Barli record has been doubted by Sircar¹ who is also supported by Dani,² and the date of this inscription on the palaeographic and other grounds has been brought down to the first century B. C. We will discuss this inscription in the fourth chapter.

COMPOUND AKSHARAS

The conjuncts are used only, in the Ramgarh cave inscriptions. In the Jogimara cave of Ramgarh hill, we find the conjunct *kyi* written correctly with a cursive medial for *i* (V. 29. ii). But in the Sitabenga cave inscription, the conjunct *ky* is read as *spha* by T. Bloch,³ the second letter *pha* being added to the secondary hook of the letter *sa* (V. 29. i). The correct

1. *JBRS*, 1951, p. 35. Sircar suggests a conjectural reading of this letter as *dva* which can not be accepted as *da* with an opening to the right is not the practice of this period except at Bhattiprolu.

2. Dani, *op. cit.*, p. 54.

3. *ASI (AR)*, 1303-4, p. 124.

form should have been like—  . Dani,¹ however, doubts this reading of Bloch.²

The so-called conjuncts of the Sohgaura plaque inscription are very interesting. There are seven symbols at the top of this plaque which have variously been explained, but we are concerned here with only two symbols which have been sometimes read as conjuncts.³ The first one is a usual crescent-on-hill symbol which is generally found on silver punch-marked coins. This sign is also found on the base of a Kumrahar pillar and on many other antiquities⁴ believed to belong to the Mauryan period. Jayaswal reads it as the monogram of Chandragupta Maurya. He takes the top crescent (III. 29. i) as *Chandra* and the remaining hill-like combination for *gutta*; the upper loop for *ga* —  and the two lower loops—  for double *tta* making it *Chandragutta*. But here it may be pointed that while Jayaswal takes *gutta* as letters of the Brāhmī script he presumes that the crescent, a symbol, stands for *Chandra*, which is a peculiar combination of writing and is hard to agree with. Similarly there is another symbol which resembles the Brāhmī *ma* (III. 29. ii), the upper crescent being separated from the lower circle. The upper ends of this symbol are slightly thick, which leads Jayaswal to think it to be the monogram for *moriya*. But the hypothesis of Jayaswal seems conjectural and far-fetched, as this symbol occurs on Indian coins spread over a vast span of space and time.

Concluding Remarks

When we review the palaeography of the inscriptions selected for the study of this period, we find on the whole that

-
1. Dani, *op. cit.*, p. 55.
 2. *ASI (AR)*, 1903—4. p. 124.
 3. Jayaswal, K. P., *EI*, XXII, p. 3.
 4. *ASR*, 1912-13, p. 78, pl. XLIX; *JRASBL*, III (1937), *Num. Suppl.*, Pl. VII-3.

these are varied in nature and technique and we also notice much difference in the formation of the individual letters. From the point of view of development, some are more advanced and cursive while others are more primitive and angular. The Piprahva vase record falls in the later category while the inscriptions of Dasaratha exhibit advanced tendencies or later characteristics more clearly than any other of the group. The equalising tendency of the verticals in the letters *ha*, *la*, *pa* etc. and the cursiveness resulting from the attempt to write the letters *ji* and *di* in a single stroke, as also the rounded forms of *bha* and *ga* should normally have been excellent pointers to the still later dating of this record. But as the inscription bears the name of Dasaratha, the grandson and successor of Aśoka, we can only label these as features of the time or as indicators of future trends. The letters of the Sohgaura record have their own face because they are cast. Similarly the inscriptions in the caves of the Ramgarh hill have a different look. As we have discussed earlier, the Piprahva vase bears a peculiar angular face and the Mahasthan record is strikingly similar in appearance to some of the inscriptions of Aśoka. But in spite of these differences, there is a unity of appearance and formation which links these inscriptions to a well defined period of time.

The Background

The second century before the birth of Christ is important from the view point of our study for two things : (i) the foreign influence was being felt more emphatically on the N.W. frontiers of India; and (ii) small native states emerged as the central authority of Magadha weakened. Though the Śuṅgas tried to keep the inherited empire intact, very soon they were no better than the petty local states. Independence gave the states authority to issue coins and experiments were being undertaken to improve the technique. As a result, first came the cast coins. The earliest cast coins are probably those uninscribed ones which come from Ayodhya,¹ Eran,² Kauśāmbi,³ Mathura,⁴ etc. The inscribed cast coins came later, and next came the art of stamping from a die which Rapson observes to 'have been known at Taxila at an earlier period than elsewhere in India'.⁵ 'The earliest specimens are struck only on one side, and by a method peculiarly Indian, according to which the metal was stamped while in a semi-molten state, with the result that the impression of the die was left enclosed

CHAPTER III

THE PERIOD OF EXPERIMENTS AND FOREIGN CONTACTS

(200 B.C. to 100 B.C.)

1. Allan, *CCAI*, p. 1xxxix.

2. *Ibid*, p. xci.

3. *Ibid*, p. xcvi.

5. *Ibid*.

in a deep incuse square'.¹ The coins minted by this method were found from Mathura,² Tripuri³ and Pāñchāla region⁴ etc. The next stage in the development is the double die system.

The experiments were not only in the field of technique of coining but the revolutionary step was also taken of inscribing legends on them. Most probably, the inspiration for this was taken from the inscribed Greek coins.⁵ The inscribed cast coins, assignable up to the end of the third century B.C., are found in an area extending from Taxila to Eran in Madhya Pradesh. The invasion of Northern India by the Yavanas during the first part of the second century B. C. is well known.⁶ Therefore, the Greek inspiration, if not influence, on the earliest inscribed coinage of India cannot be denied. Though the technique of casting inscribed metal pieces⁷ was not new in this period, the idea of inscribing the name of the ruler, city or guild on currency materialized for the first time; and experiments with the script in preparing moulds and incuse-stamps etc. were made. The superior craftsmanship of the Indo-Greek coins is evident in the Taxila coins of Agathocles and Pantaleon. On the other hand, the Negama, Kāḍa and other cast coins are clearly poorer and sometimes defective also. The reversed lettering on the coin

1. Rapson, E. J., *op. cit.* p. 14.

2. *Ibid.* p. 13.

3. *Ibid.* p. 14.

4. *Ibid.*

5. Cf. D. C. Sircar, *The Age of Imperial Unity*, p. 159; but he observes that 'even the earliest inscribed coins do not appear to be earlier than the Besnagar inscription of the end of the second century B. C.'; and thus he is inclined to attribute the inscribed coins not earlier than the first century B. C. But as it is clear from the accompanying tables VI and VII, the palaeography of some of the coin legends is earlier than the letter forms of the Besnagar inscription.

6. Narain, A. K., *IG*, pp. 82 ff. and other evidences discussed therein.

7. For example the Sohgaura plaque, already discussed in the previous chapter. May it be suggested that the Sohgaura plaque was also inspired by foreign influence ?

of Dharmapāla of Eran and the reversed *sa* in some Kāṣṭhī coins are examples of defective lettering.¹ These will be discussed in the present chapter.

Among all inscribed coins, the Negama coins of Taxila are undoubtedly the earliest. Rapson is inclined to date the Negama coins 'as early as the beginning of the fourth century B. C.'² Bühler was in favour of placing them in the third century B. C.³ and Cunningham attributes them to 'an early period of Greek rule.'⁴ These coins were found at Taxila along with the coins of Agathocles and Pantaleon,⁵ a fact which helps the dating of these coins. A. K. Narain dates the two kings in circa 180-165 B.C. and 185-175 B.C. respectively.⁶ Discussing the Negama coins, Allan observes that 'the epigraphy has been described (by Cunningham) as Aśokan, but when we see how closely the Brāhmī inscriptions of the coins of Agathocles resemble the Brāhmī of Aśoka, we realise how difficult it is to date these coins within fifty years. I am inclined to put them in the first quarter of second century B. C. If any deduction is to be made from their absence from the well known hoard of coins of Taxila, Pantaleon, and Agathocles, it is that they are later than these Greek rulers and not earlier'.⁷ While agreeing, in general, with Allan in assigning these coins to the beginning of the second century B. C., it is

1. C. C. Dasgupta, *The Development of the Kharoṣṭhī Script*, p. 24, points out that 'one out of the three Dojaka coins illustrated here (Allan, *CCAI*, pl. XXXI. 4) has the Brāhmī legend in the reversed order'. But an examination of the plate reveals that his observation is not correct. In the illustration the coin is shown upside down and therefore the legend is like **𑀅𑀲𑀭**, this cannot be regarded as a reversed legend.

2. *Op. cit.*, pp. 2 and 3.

3. Bühler, G., *The Origin of Indian Brāhma Alphabet*, p. 48.

4. Cunningham, A., *CAI*, p. 65.

5. *Ibid.*

6. Narain, A. K., *op. cit.*, p. 181.

7. Allan, *op. cit.*, p. cxxvii.

not possible to accept these to belong to a later date than these Greek princes. These two Greek kings, who were almost contemporary, not only imitated the square shape but also the incuse-stamping of the local issues.¹ 'This was done only to maintain the continuity of the local currency, and proves the earlier date of the Negama coins'.² For this we can allow a period of fifteen to twenty-five years before it was imitated by the two Greek rulers, and thus the date of the Negama coins can be fixed to about 200 B. C. The similarity of the letter *ja* in the legend *dojaka* of the Negama coins on the one hand and in the coin legends of Agathocles and Pantaleon on the other does not allow much gap between the two.

Rapson assigned some Persian and Indian coins, counter-marked with Brāhmi letters, to the fourth or fifth century B.C. on the evidence of the original coins.³ But Dani observes that 'the date of countermarking must be later than the time when these issues were current, as this practice is limited to a few coins and not to be seen at any later time. This fact makes the date considerably later than that given by Rapson'.⁴ The letter forms on these coins also point to a later date, since they roughly correspond with those of the coins of Agathocles and Pantaleon.

The coin legends which have been selected for the study of the palaeography of second century B.C. are as follows : Coins of Agathocles⁵ and Pantaleon,⁶ the coins of Dharmapāla,⁷ the Negama coins,⁸ the coins bearing the legends *udehaki*,⁹

upagodasa,¹ *upatikyā*,² *vaṭasvaka*,³ *kāḍasa*,⁴ *eraka (nya)*⁵ *tipuri*⁶ and the countermarkings with the Brāhmī letters on the Persian and Indian coins.⁷

Though the palaeography of the coins is not very reliable because of their short legends,⁸ we have endeavoured to put them within chronological limits which should not be taken rigidly.

To the last quarter of the second century B.C. can be assigned the inscription engraved on the well-known Garuḍa pillar at Besnagar caused to be inscribed by Heliodorus, who was sent as an envoy by the Indo-Greek king Antialikidas (115-100 B. C.)⁹ of Taxila, to the court of Bhāgabhadra, in the fourteenth year of the latter's reign.¹⁰ It is not easy to accept this Bhāgabhadra to be Bhāga or Bhāgavata, the ninth Śuṅga king, because none of the Śuṅga kings are known to have used metronymics as did Bhāgabhadra, who is called *Kāśīputra* or *Kosīputra* (Kautsiputra), although the use of metronymics was common during this period all over India.¹¹ And secondly, under the contemporary political situations of northern India, it is not likely that the Śuṅgas held sway over Vīdiśā during the

7. *JRAS*, 1895, pl. I. 1, 2-5, 6, 15-16, 17, 13-14.

8. Cf. Dani, *IP*, p. 62. We have preferred to attribute the unreliability of palaeography of coin-legends only to the brevity of the latter because we do not fully subscribe to the view that 'conservatism dies hard' in coinage. This may be true of coin-legends after the first century A. D., but the period with which we are concerned here was one of experimentation in scripts, when new forms were being invented. We shall discuss this further in the next chapter.

9. Narain, *IG*, p. 161.

10. Sircar, *SI*, p. 90.

11. Narain, *op. cit.*, p. 119, fn. 8.

later half of the second century B. C. They must have been forced to content themselves with the territory of Kośala and Magadha. It is also a waste of labour to identify the *mitra*-ending named kings of Pāñchāla with the Śūngas. There is considerable weight in Narain's suggestion that Bhāgabhadra was a local king.¹ It is not possible, however, to identify him with the king Bhāgavata mentioned in another Garuḍa pillar inscription found at Besnagar² inscribed in his twelfth regnal year. The palaeography of this latter inscription³ is later than that of the Ghosundi inscription assigned to the first century B. C. A general comparison of the inscriptions of Heliodorus and Bhāgavata will reveal that there is no palaeographical similarity between the two which should otherwise be expected, if we agree with the identification,⁴ since the inscriptions there will have to be accepted to have been issued within two years.

General Observations

As we have observed in the previous chapter, casting errors sometimes reverse the forms of the letters. Such errors on the coins have created

A

B

The Eran coin of Dharmapala. Fig. A shows the reversed legend made due to the defective die. In Fig. B the legend is shown mirror-wise as it should be. Here all the letters of the legend *Dhamapālasa* are in their correct shape and order.

1. *Op. cit.* p. 119.
2. *Mem. ASI*, No. 5, p. 152.
3. *Ibid*, pl, XXVI. a.
4. Narain, *op. cit.*, p. 119.

much confusion. The reverse legend of the coin of Dharmapāla led Bühler to formulate the hypothesis that Brāhmī was first written from right to left.¹ It was obviously a casting mistake and it is strange that these scholars read the reversed letters correctly but did not recognize (or emphasize ?) this fact. For example a reversed *pā* of Brāhmī looks something like a Brāhmī letter *le* and a *la* looks like a *ha*. If read correctly from right to left, this legend² will read as *dhamalehasa*, if we ignore the peculiarity of *dha*, *ma* and *sa*.

The mistakes of the Sohagaura plaque have been repeated in the cast coins also. The *o* medial to the letter *do* of *dojaka* has been wrongly put; the *ā* medial being attached to the top and the *e* medial slightly below the top—. Similarly letter *sa* on two Kāda coins has not only been reversed but also put up side down like— instead of .

The palaeography of this period, found on the coins and the inscription of Heliodorus, faintly suggests the developments which were to take place in the coming period. The angularity in the letters *da*, *ma*, *va*, *la* and *ha* etc., the rounded top of *ga*, the equalising tendency of the verticals of *pa*, *ha*, *sa* and *ya* etc., and the straight lined *o* medial are some such indications.

VOWELS

To begin with the *svaras*, we come across only *a*, *i*, *u*, *e* and *o*. In the Besnagar inscription, two arms of *a* meet the vertical at two points (VI. 1. i-ii) and on the reverse of one of the Negama coins also we find this (VII. 1. i). But on the coin of Agathocles, the two arms of *a* meet at the same point and the vertical also seems to be somewhat inclined (VII. 1. ii).

-
1. Bühler, *IP.*, p. 23. It is unfortunate that scholars like Bühler discussed here the shapes of the letters *sa*, *dha* and *ma* but ignored the reversed shapes of *pā* and *la*.
 2. Allan, *op. cit.*, p. 140.

The letter *i* is the usual three dots with its supposed apex to the right (VI. 2. i). The letters *u* (VI. 3. i, VII. 3. i), *e* (VII. 4. i) and *a* (VI. 5. i) are the usual Aśokan type.

CONSONANTS

SIMPLE AKSHARAS

Gutturals

As in the preceding period, the letter *ka* is a simple cross. In the Besnagar inscription, the vertical is somewhat longer than the horizontal, but on the coins both lines are almost equal. The medial signs for *ā* (VI. 6. i, VII. 6. ii), *i* (VI. 6. ii, VII. 6. iii) and *o* (VI. 6. iv) are correctly attached. In the letter *kha*, the hook and the circle are separated by a gap (VII. 7. i).¹ The letter *ga* is angular in the inscription of Heliodorus (VI. 8. i) but on the coins we notice rounded tops also (VII. 8. ii). The medial sign for *o* is a straight line at the top of the letter *go* on the coin legend *upagodasa* (VII. 8. iii) while we see a curious *o* medial attached to the letter *ga* in a counter-mark illustrated by Rapson.² In a rounded top *ga*, two right and left medials are added which are curved and pointing upwards (VII. 8. iv).

Palatals

There is nothing noteworthy in the letter *cha*, which is of the usual Aśokan type. While written cursively angular *cha* can also be noticed (VI. 9. i). It seems that the rounded double curved *ja* was the normal practice of northern India since the time of Aśoka,³ and continues upto this period. Written in cursive hand, it makes a loop in the middle— *ε* (VI. 10. i). Probably this loop was taken to be important because we see

1. Rapson, *JRAS*, 1895, pl. 1.6.

2. *Ibid*, pl. 1.17

3. Dani, *op. cit.* p. 39.

it emphasized in many ways. At one place in the Besnagar inscription, it is shown in the middle of a single curve in the form of another small curve joined by a small bar— ϵ (VI. 10. ii). We do not find any such example in the later period. On the coins of Agathocles and Pantaleon and on the Negama-Dojaka coins, this loop is emphasised in another way— ϵ (VII. 10. ii). The similarity of this letter in the coins of the Greek princes and the Negama coins does not allow us to imagine much of a gap between them. The angular variety of *ja* (VII. 10. i) was also optionally used during this period, and, in the first century A. D. became the most common type on the coins. The letter *ṇa* is of the usual Aśokan style (VI. 11. i).

Linguals

There is nothing unusual in the letters *ṭa* (VII. 12. i) and *ṭha* (VI. 13. i) except the cursive *i* medial in the latter. The letter *ḍa* is more cursive in the coin legend (VII. 14. i), than in the Besnagar inscription (VI. 14. i). The letter *ṇa* also retains the shape of the preceding period (VI. 15. i).

Dentals

The dentals are represented by all the five letters. The letter *ta* retains both the main types discussed in the previous chapter. The first was formed by appending a short line to an inclined straight line. This may be written in two ways— λ and — λ . Both these varieties are traceable here (VI. 16. iii and VII. 16. iii). The second main type is written by appending an angle to a vertical line— λ (VI. 16. i, VII. 16. ii). The *ā* medial is not always a horizontal stroke. Sometimes it is in the shape of a slanting stroke which becomes a regular feature of the later period.

A circle with a dot in the middle is the shape of the letter *tha* which retains its older form (VII. 17. i). But the letter *da* is found written in the angular (VII. 18. ii) as well as in the cursive (VI. 18. i-v) manner. The medials for *i* (VI. 18.

ii), *e* (VII. 18. ii), *ū* (VI. 18. iii) and *o* (VI. 18. v) are attached in the correct way. But, as mentioned above, the *o* medial in *do* of the *dojaka* cast coins is wrongly added (VII. 18. iii) which is obviously a casting mistake.

The letter *dha* on the coin of Dharmapāla of Eran is reversed because of a casting mistake (VII. 19. ii) and therefore it should be read in the corrected form (VII. 19. i). In the Besnagar epigraph, this letter is somewhat angular (VI. 19. i). The letter *na* also retains the previous form but its vertical is becoming shorter. The *e* and *ā* medials (VI. 20. iv and VII. 20. ii) are optionally slanting.

Labials

Only *pa*, *bha* and *ma* are represented in the epigraph, and the coin legends selected for the study of this period. The letter *pa* is optionally archaic on the coins (VII. 21. i) but in the Besnagar inscription both the verticals of *pa* tend towards equalization. Similar is the case of the letter *ma* which retains a perfect circle on the coins (VII. 23. i) but in the epigraph the perfection of the circle was not maintained (VI. 23. i-iii). In this the germs of the angular variety of *ma* of the later period can be marked.

Semi-vowels

Though in the majority of cases the letter *ya* is of the older type, we can notice some letters with equalised verticals (VI. 24. ii, VII. 24. i) which is a characteristic of the later period. The double crescent type *ya* is not found except in one coin where it is used as a conjunct with *ka* (VII. 30. ii). The mode of adding *o* medial to this letter is also most modern for the period under discussion, i. e., a horizontal stroke extending to the right and left side of the middle vertical. This becomes the most acceptable feature in the later period. In the Besnagar example of *yo* (VI. 24. iii), the strokes on both sides are noticeably separated, but the countermark Brāhmi

letter *yo* on a Persian coin¹ has a single straight line for the medial (VII. 24. iii).

The serpentine vertical form of *ra*, described by Bühler as the cork-screw type, seems to be the most popular (VI. 25. i, iv, & VII. 25. i). This type of *ra* is found in the Sitabenga cave inscription of the Ramgarh hills, already discussed in the previous chapter. In the *Erakanya* coin published by Rapson,² *ra* has a peculiar shape with double curves placed one over the other (VII. 25. ii). This form of *ra*, we also find used in a pavement slab inscription of Sāñchī Stūpa I discussed in the next chapter (IX. 32. iii) but never again. In the Besnagar epigraph, an optional curved form of the straight vertical is also to be seen (VI. 25. ii). In the Tripuri coin, *ra* with *i* medial looks like a *ḍa* because the *i* medial is as long as the main letter (VII. 25. iii). On the basis of palaeography, this coin can be assigned to towards the end of this century.

The letter *la* in the Besnagar inscription tends to become wider and more angular, while on the coins the older form continues (VII. 26. i-ii). Similarly *va* also continues its perfect circle on the coins (VII. 27. i) but at Besnagar, it is not as perfect (VI. 27. i-ii). Though nothing definite can be derived from the shapes of *va* at Besnagar, we can see the germs of the angular *va* of the centuries to come.

Sibilants and *Ha*

Among the records of this period, we find only dental *sa* in use. Smith³ prefers to read the letter *sa* on the coin of Pantaleon as *sha* because this letter (VII. 28. iii) resembles Aśokan *sha*. But as we have discussed in the previous chapter⁴ this may be another form of *sa*. We can notice the equalising

1. Rapson, *IC*, pl. I. 4.

2. *JRAS*, 1900, pl. VII. 7.

3. *IMC*, p. 10.

4. *Supra*, pp. 36-37.

tendency of the verticals of *sa* (VI. 28. i-iii & VII. 28. i). In some *kāḍasa* coins, the letter *sa* is not only reversed but also put upside down (VII. 28, ii), which is a casting mistake. The medial signs for *i* and *ī* (VI. 28. ii-iii) are cursive and conventional.

The letter *ha* in the Besnagar epigraph has an angular formation, the left vertical becoming shorter while the right one becomes longer (VI. 29. i-ii). But in the *udehaki* coin legend, this letter has almost equal verticals while retaining its archaic look (VII. 29. i) and, therefore, it can be dated in the last quarter of the second century B.C.¹

COMPOUND AKSHARAS

Groups with initial guttural

On the coins, we have two compound letters with *k* as the initial letter. These are *kla* and *kyā* (VII. 30. i & ii). Incidentally, in both the conjuncts, all letters have verticals. Therefore, a single vertical has been used for both the letters, following the established rule since the time of Aśoka that the letter pronounced first will occupy the upper position and the next will be in the lower one. In the conjunct *kla*, the right vertical of *la*, which is usually the longer one, serves as a vertical for *ka* also; and in the conjunct *kyā*, the middle vertical of *ya* takes this position. In both cases, the conjuncts are so adjusted as not to take more space than an average letter.

In the Besnagar inscription we find a conjunct with double *kha*. To form this letter, a normal *kha* is made and then a stroke to the left is attached slightly above the circle like— (VI. 30. i). Probably this downward stroke is meant to be the other *kha*.² R. P. Chanda remarks that 'the double consonant, *khkha*, is remarkable. In literary Prākṛits an aspirate

1. Allan, *op. cit.*, p. cxli.

2. Cf. Sircar *SI*, p. 90; *Mem. ASI*, No. 1, p. 16 for the reading of the word *Takhkhasilākena*.

is doubled by prefixing the nonaspirated sound as *kkha'*.¹ Probably he wants to suggest that the downward stroke represents *ka*, which, however, is doubtful. The angularity of the hook of *kha* and the elongated circle is noteworthy in this compound letter.

Groups with initial Dental

The compound letters are found made with the initial *ta* and *dha*. So far as the group with initial *ta* is concerned we find the conjunct *trā* (VI. 30. iii). To the right leg of *ta* the serpentine *ra* is added. The next compound letter *dhva* (VI. 30. ii) is formed by extending the vertical of *dha* downwards and then appending a circle to it. These conjuncts are in accordance with the rule.

Groups with initial Labial

The compound letter of this group is *pra* (VI. 30. iv) formed by appending a serpentine *ra* to the bottom of letter *pa*. The equalised verticals of *pa* are remarkable.

Groups with initial Sibilant

The compound letters found with initial *sa* are only in conjunction with *va*. This we find in the coin legends as well as in the Besnagar inscription. At Besnagar, the letter *va* is appended to the right hook of the letter *sa* (VI. 30. v), while on the *vaṭasvaka* coin, *va* is attached in the alignment of the main vertical of *sa* (VII. 30. iii).

Concluding Remarks

We need not emphasize the fact that the palaeography of coins is doubtful and we should not give too much importance to it. But it has been the tragedy of Indian archaeology that the basic chronology of the north Indian excavations of the early historic period is founded on triple evidence—(i) the date

1. *Mem. ASI*, No. 1, p 16, fn. 1.

of N.B.P. Ware; (ii) the occurrence of punch-marked coins and (iii) the palaeography of the letters appearing on coins and seals. In general the excavator falls back on coins to date his N.B.P.; and the numismatist has been repeating the words of John Allan on the date of palaeography as if Allan's statements are final. But the palaeography of coin legends can not be reduced to a definite chronological boundary'.¹ However, it has been said about Allan that 'no systematic attempt was made by him to analyse the letters, and when no other evidence was available he fell back on the style of writing'.² We have already noted the characteristics traceable in the records of this period which became the regular features, in a modified form, of the subsequent century. We feel no necessity of repeating them here again. The small and scanty nature of the material available in this period, except the Besnagar one, prevents us from having the many types and varieties which we could have had otherwise.

A new approach has been made here to study the palaeography of the coin legends in the cultural context. In the second century B. C. the north western frontier of India was primarily affected by the cultural and political contacts with the foreign invaders who tried to settle down on Indian soil and influenced the local culture considerably. Several experiments were undertaken by the indigenous people in the field of coin technology but we see that in the subsequent centuries foreign methods were accepted in this field. Greek palaeography influenced the palaeography of the Brāhmi script. Brāhmi letters tended to take shapes nearer to the Greek letters. Greek letters were almost equal in length and breadth and looked more beautiful in the limited space on the borders of the coins. They were convenient too. This quality of the Greek letters influenced the Brāhmi *aksharas*, whose verticals started being reduced on coins. These experiments continued in the next century also

1. Dani, *JNSI*, vol. XXII, p. 1.

2. Dani., *IP*, p. 59.

till Brāhmī acquired a new look by the beginning of the first century A.D. But this is not the only contribution of this period. The legends engraved on the coins, as compared to the inscriptions on stone made the script easily accessible to the people. This contributed much towards the diffusion of the knowledge of the writing. We have reserved this for discussion in the next chapter.

CHAPTER IV

THE PERIOD OF DIFFUSION

(1st Century B. C.)

The period of experiments with the Brāhmī script did not end with the end of second century B. C. ; rather it continued, on a bigger scale, in the first century B. C. also. The main impulse to this accelerated development came with the attempt to make Brāhmī more and more convenient for the coin legends where the space is very limited. For this, Greek coins and Greek script served as model. The regions which were nearest and therefore in closest contact with the Greeks were inspired more emphatically to a rapid change. For example, in the lettering on the earliest Yaudheya coins bearing the legend *yaudheyānām bahudhāñake*,¹ an attempt is made to resemble the lettering on the Greek coins. A perfection in this kind of imitation was achieved by the Kuṇindas, especially in the coins of Amoghabhūti.² The coins thus served as pioneers in the field of script style at least in this period, and it is not reasonable to hold the view that the coins are conservative in this respect.³ This is true for the Brāhmī script at least up to the period of the Śaka Kshatrapas of Mathura. A comparison of Table VIII of the coin Series No. II (1st century B. C.) with the inscriptions assignable to the first

1. Allan, *CCAI*, pl. XXXIX.

2. *Ibid*, pl. XXII.

3. Cf. Dani, *IP*, p. 62.

century B. C. (Tables IX-XIV) and the Table XV of the coin Series No. III with the inscriptions assigned to the early first century A. D., will reveal that the letters on the coins are more advanced and modern than the script on the stone.

But this is not the only contribution of the use of script on coins. As we have said in the previous chapter, the script reached the people more easily and more frequently through coins. As a consequence more and more people must have become interested in the mysterious and powerful art of writing. Once more religion came forward as a help. Though the Ghosundi and Bhilsa inscriptions are associated with royal names, their theme is popular, that is to say, religious. The reconstruction and enlargement of the great stūpas at Sāñchī and Bhārhut were in progress in this period and the enthusiastic *uṇṇāsakas* as well as *bhikshus* took an active part in this and gave donations towards it. Besides their religious zeal, the temptation to have their names engraved on such colossal monuments, contributed much towards the completion of these stūpas. It is not easy to imagine what percentage of the donors was illiterate and how many learnt the script to enjoy the thrill of reading their own names. Undoubtedly this was a great achievement towards the popularisation of script.

On the grounds of palaeographic development we have assigned the early inscriptions of the Sāñchī (Tables IX & X) and Bhārhut stūpas (Table XI) to the first century B. C. This is not in agreement with the general belief that the railings on these stūpas were made during the time of the Śuṅgas. There is, however, no evidence for the latter except the palaeography, which has been used by Indian archaeologists as a rubber tape to extend or contract at convenience. The mention of the Śuṅgas on the eastern gateway at Bhārhut also does not really help us much on this point. Palaeographically this inscription can be assigned to the beginning of the first century A. D.

In support of our scheme of chronology we will first quote

R. P. Chanda and then give our arguments based purely on the palaeographic observations. He¹ writes :—

“...the Brāhmī inscriptions from the third century B.C. to the second century A. D. may be chronologically arranged in the following order :

1. Edicts of Aśoka.
2. Nāgārjunī Hill cave inscriptions of Aśoka's grandson Daśaratha.
3. Besnagar Garuḍa pillar inscriptions (sic).
4. (a) Inscriptions on the railings of Stūpa I at Sāñchi.
 (b) Inscriptions on the railings of Stūpa II at Sāñchi.
 (c) Bhārhut railing inscriptions.
 (d) Inscriptions on the remnants of the old Bodh Gayā railing.
5. (a) Besnagar Garuḍa pillar inscription of the year 12 after the installation of *mahārāja* Bhāgavata.
 (b) Inscriptions of Nāyanikā, widow of the Āndhra king Sātakaṇi I in the Nānāghāt cave.
 (c) Bhārhut *torāṇa* (gateway) inscription.
6. Hāthigumphā inscription of Khāravela, king of Kalinga.
7. Sāñchī *torāṇa* inscriptions.
8. Inscriptions of the time of Śoḍāsa.
9. Inscriptions of Kanishka.,

Palaeography was undoubtedly the basis for the above arrangement by Chanda, although he does not try to date these groups individually. However he quotes in his support the authority of Sir John Marshall who follows the same chronological arrangement in his study of the development of early

1. *Mem. ASI*, No. 1. pp. 14-15.

Indian art. Marshall's testimony, in the words of Chanda, runs as follows :

'The sculpture on the railing of the Bhārhut stūpa he (Marshall) assigns to the middle of the second century B. C., and those on the gateway to a later date; the original sculptures on the ground rail of Stūpa II at Sāñchi to about the same time; the railing of Bodh-Gayā to the earlier years of the first century B. C. ; the sculptures in the Māñchapuri Caves at Udayagiri, in the upper storey of which the inscription of Kharavela's queen is incised, to a date considerably posterior to the sculptures of Bhārhut; the reliefs on the four gateways of Sāñchi to the latter half of the first century B. C. and the sculptures of the time of the Śaka Satraps of Mathura to about the beginning of or a little before, the Christian era.'¹

Chanda's reference is obviously to Marshall's chapter on 'The Monuments of Ancient India' in *The Cambridge History of India*, Vol. I. Marshall may be produced in support to the extent that within a known historic framework and with generic relationship assumed, it should be possible to arrange different manifestations of art or art-styles into a tentative relative chronology. But, for more precise and absolute chronology, the evidence of dated inscriptions and consequently of palaeography will have to be considered. Marshall himself does not appear to dispense with them; only, in his short account of ancient Indian monuments, he generally takes them for granted. However, whether or not Chanda is fully justified in bringing Marshall to his support, we agree in general outline with the two authors and, on that basis, offer the following review of the chronology of the inscriptions of this period.

As regards the edicts of Aśoka and the Nāgārjunī cave inscriptions of Daśaratha, there is no dispute about their dating

1. *Op. cit.*, p. 15.

in the third century B.C. Next in order comes the Besnagar Garuḍa pillar inscription of Heliodorus. Its date must be that of Antialcidas, whom he represented in the court of Bhāgabhadra, the son of *Kośī* or *Kauśī*. A. K. Narain assigns him a reign of 15 years towards the end of the second century B.C., i. e., circa 115 B.C. to 100 B.C.¹ We agree with this dating which can not be pushed back too much to effect our scheme.

In the next group Chanda mentions four sets of inscriptions; inscriptions on the railings of Stūpa I at Sāñchī, those on the railings of Stūpa II at Sāñchī, the Bhārhut railing inscriptions, and the inscriptions on the remnants of the old Bodh Gayā railing. Obviously these should find place in the first century B. C. except the Bodh Gayā one. The triangular forms of the letters *ma* and *va*, the equalised verticals of *pa* and *sa*, and the use of long tailed *i* medial are some of the features which do not fit with the other sets of inscriptions and point towards the subsequent period, i. e. the first century A.D.²

We have grouped the inscriptions of Sāñchī, assignable to the first century B.C., into two series. In the first are included the majority of inscriptions incised on the railings of Stūpa I and the inscriptions scratched on the caskets found in Stūpa III. The palaeography of this series is closer to that of the Besnagar inscription of Heliodorus, but there are some features such as the straight vertical of *bha* and a single horizontal line for the *o* medial, which are pointers to further development. Series II of Sāñchī includes mostly the inscriptions engraved on the railings and those scratched on the relic caskets from Stūpa II. The inscriptions on the railings, on both the stūpas, show a variety of hands, while those on the caskets exhibit unity. The rounded *ga*, double looped *chha*, a single horizontal line for the *o* medial, and the marked angularity of most of the letters definitely indicate the posteriority of the second series.

1. *IG*, p. 181.

2. See *Infra*, Chapter V.

The inscriptions on the caskets are more advanced because of the reduced verticals, angularity, *i* medials, and especially the mode of adding the *u* medials to the letters *sa* and *pa* by extending the right vertical downwards. These are the features which gave a new style to Brāhmi when written by the new pen, introduced in the first century A.D. Thus there seems no difficulty in assigning series II to the later half of the first century B.C. and Series I to the earlier half. The railing inscriptions of Bhārhut, Series I, are also to be placed in the later half of this century on the grounds of palaeography.

The fifth group of Chanda can be assigned to the close of the first century B.C. To this group may be added the inscriptions found at Ghosundī and Barli. In this group of inscriptions we mark a tendency to create letters in a way which was responsible for the new pen style of the first century A. D. Attempt to equalise and angularise the verticals of *pa*, *sa*, *ha*, etc., the tendency of transforming the oval of *ma*, *va* and *kha* into a triangle, and the way in which medials for *u* and *i* are attached are some traits of this period from which the new pen style was inspired. The casket inscriptions of Stūpa II at Sāñchi may also be noticed for these features.

His sixth, seventh and eighth groups are assignable in the first century A. D. and therefore will be considered in the next chapter. The Kushāṇa inscriptions beginning from the last quarter of the first century A.D. are discussed in the subsequent chapter.

The first century B. C. is comparatively rich in palaeographic material from the numismatic sources. It is not possible to agree with D. C. Sircar that the earliest inscribed coins do not appear to be earlier than the Besnagar inscription of the end of the second century B. C.,¹ because 'the fashion of mentioning the name of the ruling authority in the coin legend was inspired and popularised in India by foreign kings beginn-

1. *Age of Imperial Unity*, p. 159.

ing with the Indo-Greeks'. We have already shown, there are some coin legends which can be assigned to the second century B.C. on palaeographic grounds.¹ A palaeographical analysis shows that the coin legends which can be attributed to the first century B.C. are —

1. The coins of the Ārjunāyanas bearing the legend *ārjunāyanānām jaya*.
2. The legends on the coins attributed to Kanauj by Allan.
3. Early Kauśāmbī coins.
4. Mathura local coins.
5. Coins of Rājanya and Trakata *Janapadas*.
6. Early Yaudheya coins.
7. Coins of the Śibi *janapada*.
8. Mālava coins bearing the legends *mālavānām jaya* and *senāpatis vachhaghosa*.

Our table VIII represents characteristic letter forms taken from the photographs of the coins published mainly in Allan's *CCAI* and the volumes of *JNSI*. The majority of the plates in the volumes of *JNSI* are not clear enough and most of the readings cannot be verified from the photographs. We have had to depend, therefore, mainly on the excellent plates of Allan's book though a good deal of new Kauśāmbī and Pañchāla coins of this period have come to light since the *CCAI* was published by the British Museum in 1936. These new coins were mostly published in *JNSI* which we could not use with satisfaction. However, an explanation of the letters illustrated can be found in the 'Explanation Table' of Table VIII.

This century is also marked by the use of inscribed seals, as far as we have for the first time since the Indus

1. *Supra*, pp. 45 ff.

civilization. The seals are personal as well as official. Some of the seals which can be attributed to the first century B. C. on the basis of palaeography are those bearing the legends *Vasubhūti*,¹ *mālava janapadasa*,² *śahijitiya nigameśa*,³ etc. Regarding the dating of the seals, and sometimes also of the coins, it has become general fashion to date letterings which are not clearly Śaka or Kushāṇa, to the third-second century B.C. This convention can be seen in any article dealing with the inscribed coins or seals.

We are not interested in building our thesis on the criticism of the datings of the past scholars, but we may select a few instances for illustrations. In *JNSI* volume XXIV (1962) pp. 193-94, R. C. Agrawala describes and dates some seals and coins found in the excavations at Rairh, most of which are illustrated in K. N. Puri's *Excavations at Rairh* plate XXVI Nos. 19-24. According to Agrawala, the earliest seal in this group is a tiny seal impression in relief on a half-cut terracotta ball with No. R. 3096, pl. XXVI/19 only two letters *m* and *d* in 3rd-2nd century B.C. Brāhmī script. But the letter *da* of this seal opens to the right, as we find in the inscriptions of the first century A.D. and afterwards. To the second century B.C. he assigns the seals with the legends *mālava janapada* (22), *vasubhūti* (21), *sarvadata* (20) and *vachhūsaiṇyagopa* (l. ?) *ya* (24). The letters *la*, *pa*, and *sa* of the legend *mālava janapada* are angular and in our opinion may belong to the end of the first century B.C. Here it is interesting to note that the letters *la* and *sa* of the second line of this seal are written upside down as if to be read after turning the seal round. The oval shape of *va*, the equalising verticals of *s*, the double-looped *chha*, the angular *pa*, etc. are some features of remaining two seals which are characteristics of the first century B.C. Another example of such loose dating is that of *nigameś* seal from Bhita which is

-
1. *Excavations at Rairh*, plate XXVI, 21.
 2. *Ibid*, XXVI, 22.
 3. *ASI(AR)*, pp. 11-12, pl. XVII.

dated in circa third century B.C.¹ Such instances can be multiplied but here we only want to emphasize that sometimes the dating of the seals is done loosely, without considering their palaeography seriously.

With these primary remarks about the records selected for the study of the palaeography of this period, we are now in a position to deal with the formation of individual letters and, as far as possible, to point out their relationship with the preceding and succeeding ones. We will also try to trace the development that took place within the century.

VOWELS

Beginning with the vowels, one finds that although there are two varieties of the letter *a*, i. e., (i) both the arms meeting at one point and then joining the vertical (VIII. 1. i; X. 1. i; XI. 1. i) and (ii) with a gap between the arms (IX. 1. i; X. 1. ii; XI. 1. ii); the latter variety has been used in majority of the cases. In the votive inscriptions of Sāñchī this form has been used as a rule and has been called 'the standard monumental form of the letter'.² In the Sāñchī pillar inscription of Aśoka and in the Besnagar pillar inscription of Heliodorus (VI. 1. i, ii) only this form appears, and becomes a characteristic feature of post-Aśokan writing. At Bhārhut this form is noticed in quite a large number of cases, but the first variety also persists there.

The letter *i* continues its older form of three dots; generally the apex being to the right (IX. 2. i, XI. 2. i, ii), though sometime also at the top (X. 2. i). Similarly the letter *e* also continues its simple angular shape written with a varying degree of cursiveness (VIII. 3. i, IX. 3. i, X. 3. i, and XI. 3. i). At Bhārhut Series I for the first time we find long *ū* (XI. 4. i). This letter is formed by adding one bar to

1. *ASI(AR)*, pp. 11-12, pl. XVII.

2. Majumdar, N. G., *MS*, p. 265.

the middle of the vertical of the angle like . Upasak opines that this shows a combination of two *us* i. e. $L+L=L^1$. We do not find much change in the shape of *e*. Though in the Sāñchī Series I, it retains its triangular shape, with its apex at right (IX. 5. i), we notice that at Bhārhut its angular apex at the right tends to be curved (XI. 5. i). Though the letter *o* is used in several Aśokan edicts, it occurs for the first time among the post-Aśokan records at Sāñchī I (IX, 6. i). It is formed simply by adding a horizontal stroke to the sign of *u*, . Upasak notices here the rule of *guṇa* combination applied. According to this rule *o* is composed of $\bar{a}+u$. He applies this to the symbols also and observes that 'the medial sign for \bar{a} is a small horizontal dash (—) and when it is added the sign *u*, , it becomes *o*, '.² But this is not acceptable because, firstly, a dash to the left of the letter is the sign for the medial *e* and not for *a*; and, secondly it is not possible to apply the Sanskrit grammatical rules to the signs of the Brāhmī letters.³ He also puts forward the argument that the letter took this shape to avoid letter *ṇa*; this argument also is not convincing because we do not find examples of *ṇa* until much later,⁴ when Sanskrit began to be used for inscriptions.

CONSONANTS

SIMPLE AKSHARAS

Gutturals

The letter *ka* continues its cross shape. Though in some cases in the inscriptions of Bhārhut and Sāñchī *ka* is of the

1. *HPMB*, p. 16.

2. *Ibid.*

3. Cf. Verma, T. P., *JOI*, XIII, No. 4, p. 365, where we have dealt with this problem in some detail.

4. See, Plate IV.

shape of a perfect plus sign of equal arms, generally the vertical is longer than the horizontal bar. In adding the \bar{a} (IX. 7. i), i (IX. 7. ii), e (XIV. 7. i) and u (IX. 7. iii & XI. 7. iii) medials the older practice is followed, but some new trends and peculiarities can also be noticed. For example we can see cursive variety of i medial (XI. 7. ii); a slightly slanting stroke for e medial (IX. 7. iv) instead of a horizontal one; a simple line extending towards right and the left of the vertical for o medial. This type of o medial becomes a regular feature in this period.

There are three types of the letter *kha* in these inscriptions : (1) the round-topped *kha* without a dot (IX. 8. ii, X. 8. iii, XI. 8. ii & iv); (2) round-topped *kha* with a dot (X. 8. i); and (3) round-topped *kha* with a circle (IX. 8. i, X. 8. ii, XI. 8. i, iii, v). In some cases this circle is not perfect. I medial is attached in the traditional manner. The u medial sign is added in two ways. If the letter is appended with a circle, a short bar is added below it vertically (X. 8. ii; XI. 8. iii); but if it is the type of *kha* without a dot a short horizontal bar is attached to the right of the lower tip of the letter (X. 8. iii). The o medial sign is neither a horizontal line extending to the right and left of the letter nor two separate horizontal strokes, but it is formed by two slanting strokes (XI. 8. iv, v). This practice becomes more frequent in the first century A. D.

The letter *ga*, in this period, is to be seen variously from angular top to the round top (see Plate III. line 9). One of the most striking features noticed here is the mode of attaching the sign of o medial, in which different evolutionary steps can be traced. After two separate dashes of \bar{a} and e medials, which together make an o medial sign, a horizontal bar was used for this (VIII. 9. i; X. 9. iv; XIII. 9. i). The next step was to curve this line (XI. 9. iii) and finally this curve takes the shape of two slanting strokes (VIII. 9. ii). The medial sign for u is shown simply by curving the right leg towards the right (X. 9. iii).

There are two distinct types of the letter *gha*, i. e., the old round-bottomed type, and the flat-bottomed type (IX. 10. i) which is a new development. There is a tendency towards shortening the left verticals and in Sāñchī II, we find almost equalised verticals (X. 10. i-ii). The medial sign for *ā* (XI. 10. ii); *i* (IX. 10. ii; XI. 10. iii) and *o* (XI. 10. iv; VIII. 10. i) are added to the left arm. At one place the *u* medial is shown by extending the middle vertical a little below (IX. 10. iii).

Palatals

The letter *cha* is usually of the same old semicircular loop type (IX. 11. i, XI. 11. i-iv), but the triangular loop type *cha* (IX. 11. iii) is also to be seen. The medial sign for *i* is added to this letter in two ways, either by adding a curved medial at the top of the letter (IX. 11. ii) or by adding the curve slightly below the top to the right side (X. 11. iii). The *u* medial sign is also attached in two ways. Sometimes an extension of the vertical takes place below the letter to show this medial (IX. 11. iii; X. 11. i) and sometimes a horizontal dash is added to the bottom of the letter extending to the right (XI. 11. iv). The long *ū* medial is shown by adding two such dashes (XI. 11. v). The *ā* (XI. 11. ii) and *e* (XI. 11. vi) medials are in the traditional fashion.

We find only two types of the letter *chha* in these inscriptions, i. e. *chha* with an oval base (VIII. 12. i; IX. 12. ii) and *chha* with a double loop at the base (X. 12. i-ii, XI. 12. i-iii). The latter is the evolved form. The medial signs of *i* (XI. 12. ii), *u* (IX. 12. i; XI. 12. iii) and long *ū* (VIII. 12. ii) are all shown in the old traditional way.

There are at least two types and many varieties of the letter *ja*. The two main types are the three-armed *ja* and the double curved *ja*. The three-armed *ja* has two varieties, i.e., with straight vertical (VIII. 13. i, XI. 13. iv); and with curved

vertical (VIII. 13. ii, XIII 13. i). The double-curved types have many varieties. Besides two simple curves placed one upon the other (IX. 13. i, X. 13. i, XI. 13. i-iii and iv-v, XII, 13. i), another variety emerges out of the movement of the pen in cursive hand, forming a loop in the middle (IX. 13. ii-iii). This loop is emphasized in another way when artistically written in the inscription of *Vajiguta* at Sāñchī (IX. 13. v). There are some intermediate forms between these two main types (VIII. 13. iii-iv).

The medial sign for \bar{a} is added variously in this letter. Sometimes it is shown by extending the middle arm (IX. 13. iv) and sometimes a stroke is added in the middle of the upper curve if it is the double-curved variety (XI. 13. iii), and if it is a three-armed *ja*, an additional stroke is added upon the upper arm making four arms (XI. 13. iv) in both the cases. Sometimes a slanting stroke is added to the upper arm of the curve (XI. 13. ii) to indicate an \bar{a} medial. A slanting stroke is added to the middle arm to show an *i* medial (XI. 13. v) and sometimes it is shown by extending the upper arm vertically (IX. 13. v). The medial sign for *u* is shown by extending the lower arm vertically downwards (VIII. 13. iv) and the *e* medial sign is attached to the upper curve to the left of it (XI. 13. vi).

The letter *jha* is simple and has no variety or type (Plate III, line 14). The medial sign for \bar{a} (IX. 14. i) and *i* (IX. 14. ii, XI. 14. ii, XIV. 14. i) are added variously to both the verticals according to convenience.

There is no change in the formation of the letter $\tilde{n}a$. On the coins the right hook is comparatively smaller (VIII. 15. i) while on the stone records the right hook reaches the left leg (IX. 15. i-ii, XI. 15. i-ii). *O* medial is shown by a small bar making a cross at the neck of the letter (XI. 15. ii).

Linguals

The sign for the letter *ṭa* is a small semicircle opening to the right, and is one of the letters least susceptible to change.

A vertical dash added to the upper end of the letter makes the *i* medial (IX. 16. i, X. 16. i, XI. 16. ii) and such a dash to the lower makes a *u* medial (XI. 16. iii).

Similarly the letter *tha*, which is a complete circle, is also not very susceptible to change and it retains this shape since the time of Aśoka. The sign for *i* medial to it is the same as for other letters with straight vertical and is generally attached at the 2 O'clock point of the circle (IX. 17. ii, X. 17. i, XI. 17. ii).

Though the letter *da* retains its older shape in many cases (VIII. 18. i, X. 18. i-ii etc.), some hurriedly written forms are also to be seen (IX. 18. ii). The signs for *ā*, *e*, *i* and *u* medials are as usual. Long *ī* is shown by two lines (IX. 18. ii).

The letters *dha* and *na* continue their old Aśokan forms (Pl. III, line 19 and line 20). The mode of adding *ā* and *i* medials is also the same.

Dentals

Among the dentals there are at least three main types of the letter *ta*. The angular *ta* with the two lower appendages making an angle can be seen at Sāñchi I (IX. 21. ii & v), Bhārhut I (XI. 21. iii-v) and Barli (XIV. 21. i-ii). The curved type of *ta* with its two lower appendages meeting in an upper curve is to be noticed on the coin legends (VIII. 21. i, iv, vi) and at Bhilsa (XIII. 21. iii). The third type has two varieties : (a) with its angle-making stroke to the left (VIII. 21. ii, v; IX. 21. iii); and (b) with its stroke to the right (VIII. 21. iii; IX. 21. i, iv; X. 21. ii; XI. 21. i; XIII. 21. i). The medial sign for *i*, *ī*, *u*, *e* etc. are as usual, but in some cases a slanting stroke serves as *i* medial (X. 21. ii) and a single line indicates *o* medial instead of two separate strokes (XI. 21. v).

The letter *tha* is another which shows little change, i. e., the dot in the circle still continues. A single downward stroke serves for the *u* medial (XI. 22. iv) and two such strokes are

used for long *ū* medial (X. 22. ii). Similarly single and double-curved upward strokes are used for the medials *i* and *ī* (XI. 22 ii & iii) respectively.

Letter *da* is more susceptible to change and a glance at line 23 of plate III will reveal that its shape varies much. However, in almost all the cases the middle opening is still to the left. When written hurriedly this letter sometimes resembles *ḍa* (IX. 23. i, cf. XI. 18. ii) and sometimes *ja* (e.g. IX. 23. vi, cf. XIII. 13. i). For medial signs the usual practice is followed.

The letter *dha* is sometimes regarded as important from the viewpoint of the development of the script.¹ In most of the Aśokan inscriptions this letter is of the shape of the Roman capital letter D.² The same is the shape in the Mahāsthān and Piprāhvā inscriptions.³ But in the later inscriptions it has a reverse form. At Sāñchi and Bhārhut the vertical stroke appears to the right of the loop (IX, X, XI line 24). The medial signs are used in the conventional way, but sometimes there seems some confusion regarding the medial *u*. In some instances, this is shown by extending the vertical line downwards (IX. 24. iii & XI. 24. v), but in others a small horizontal bar is used (XI. 24. iv).

Ever since the time of Aśoka, the letter *na* retains the same shape, i.e. a vertical line touches a horizontal one in the middle. The medials are attached in the conventional ways. It is worth noticing that in some examples of *so*, *ro*, *po*, *bo*, etc., a single line serves for the *o* medial, but this is never used in the case of the letter *na*. There are always two strokes to indicate the *o* medial.

Labials

Though in the majority of cases *pa* retains its archaic form of a hook, certain new features can be observed which may

1. Majumdar, N. G., *MS*, p. 265.

2. Cf. Dani, op. cit., pl. IIIa; IVa; and Upasak, op. cit., p. 82.

3. Cf. our Table I, line 16.

be regarded as modern tendencies from the point of view of future development. These are, (i) the equalisation of the verticals (VIII. 26. i. iii; IX. 26. ii, iv; X. 26. iv, v; XII. 26. i; XIII. 26. i) and (ii) the angularity of the curve of the hook (VIII. 26. iii; XI. 26. ii, v; XII. 26. i; XIII. 26. i). Similarly, though the medials for *ā*, *e*, *i* and sometimes *u* and *ū* are attached in the old fashion; the medials for *o* and *u* are of more modern type. A single-lined medial, instead of two strokes, has very often been regarded as a later tendency.¹ This we find in many cases (IX. 26. v; X. 26. v). In the same way, the downward extension of the right vertical for *u* medial (VIII. 26. iii; IX. 26. ii; X. 26. iv; XIII. 26. i) has also been taken to be a later practice² But it is not correct to say that the older practice of adding *u* medial in the middle of the curve persists only in Bhārhut I,³ which has been assigned to the later half of the first century B. C. by Dani,⁴ because this can be seen in the inscriptions assigned to this century (IX. 26. iii; X. 26. iii & XII. 26. ii-iii).

The letter *pha* is one of those letters which are used very rarely. Its shape is almost the same since the time of Aśoka; and the same old practice of adding *i* (IX. 27. i; X. 27. i) and *u* (IX. 27. ii) medials is followed. The short left vertical of *pha* at Bhārhut can be marked as, during the coming century, the short vertical becomes a characteristic of this letter.

The letter *ba* still continues its square shape but sometimes it is rectangular (IX. 28. v) which is not very important from the view point of development. In some instances, the angles are curved also (IX. 28. i, ii). As regards the attachment of the medial signs to this letter, there seems some confusion. Sometimes *o* medial is shown by extending the top line towards

1. Majumdar, N. G., *MS*, p. 266.

2. Dani, *op. cit.*, p. 58.

3. *Ibid.*

4. *Ibid.*, p. 59.

left and right (IX. 2. v; XI. 28. vi) but in some instances two short bars shoot from the middle of the left and right verticals (IX. 28. vi). Similarly there is no definite practice regarding *u* medial also. This could be shown by extending the right vertical downwards (IX. 28. iii; X. 28. ii; XI. 28. iii) or by adding a downward stroke in the middle of the lower horizontal line (IX. 28. ii; X. 28. i; XI. 28. iv). For long *ū* medial two such strokes serve the purpose which form an angle on the lower horizontal line (XI. 28. v). But this is not all. As we will see in the Compound Akshara section of this chapter conjunct *bra* has also been shown in the same ways (Cf. VIII. 40. v; and VIII. 40. iv; XI. 40. iv). For that reason, one could have been confused with the other. Same uncertainty prevails in the case of *i* medials also. For example *i* and *ī* medials can be attached to the upper right corner (VIII. 28. ii. and XI. 28. i, ii respectively) as well as in the middle of the right vertical (VIII. 28. iii). This, however, does not creat any confusion.

The letter *bha* is also regarded as one of those letters which are most susceptible to change.¹ The standard Aśokan *bha* has got a broken right vertical,² though straight vertical *bha* is also not unknown³ in the post-Aśokan period straight vertical *bha* becomes most frequent. But at Sāñchī in some cases older form also persists (XI. 29. i). Among the straight vertical *bha*s, legs are, very often, of equal length but sometimes the right leg is bigger than the left one (XI. 29. vi; XIII. 29. i). The sign for *o* medial is mostly of the straight line type, and *i* medial, in many cases, is a curved line but sometimes a slanting stroke (IX. 29. iii) serves its purpose. There is nothing new in the *ā*, *u* and *ū* medials which continue the older practice.

The letter *ma* can be seen in many shapes (Pl. III, line 30), all of which cannot be regarded as varieties (especially IX. 30. i-iii) because they have no bearing either upon the

1. Majumdar, N. G., *MS*, p. 266.

2. Upasak, C. S., *op. cit.*, p. 88.

3. *Ibid.*

future development or on the present script. More or less they can be accounted for as due to carelessness. In some cases the lower circle is of a good round shape while in others its roundness varies. This variation paves the way for future development in which a triangular-based *ma* becomes the standard form.

Semi-Vowels

During the century under discussion, wedge-shaped *ya* (IX. 31. ii) and double-curved *ya* (X. 31. ii; XIV. 31. ii) become rare but crescented *ya* (VIII. 31. i, iii; IX. 31. i; X. 31. iii; XI. 31. i-ii; XII. 31. i; XIV. 31. i) has been used in majority of cases. We notice, however, two major developments in this letter. Firstly, there is a marked tendency to reduce the middle vertical and equalise with the side ones. Though this can be seen in the stone inscriptions too, it is more emphasized in the coin legends (VIII. 31. i, iii). Secondly, there is a tendency to make the bottom of the letter flat (IX. 31. iii, iv; X. 31. i). These characteristics are important because of their role in the future development of the letter. We have noticed above that the coins were pioneers in the field of script technology. This is best illustrated in the form of this letter on the coins; specially *Yaudheya* coins. In these coin legends, not only are the verticals equalised but the two slanting strokes for the *o* medial (VIII. 31. iii) pave the way for its popularisation in the next century.

The letter *ra* does not show much variation. The straight line *ra* is most frequently used (Pl. III line 32) but the so-called 'cork-screw' *ra* can also be seen (XII. 32. i-iii). A peculiar formation of *ra* made by two curves placed one upon the other (resembling *ja*), which has already been noticed in the coin series No. 1 (VII. 25. ii), can be seen in the *Sāñchī* inscriptions also (IX. 32. iii). The sign for medial *o* in some cases is a straight line but in others it is two lines to the left and right of the letter. The left stroke is always at the top but the right stroke has been put anywhere on the right from a

little below the top to the middle of the letter. There is a possibility of confusion because the *u* medial, which is also placed to the right but in the lower half of the letter (VIII. 32, ii), sometimes occupies its position to the middle of the letter (IX 32 iii). *Anusvāra* is shown by a dot to the right above the letter (XIV. 32, iii).

Though the letter *la* resembles the letter *pa* in its formation, it does not seem to have many variations (pl. III, line 33). But the tendency to equalise the verticals and angularise the curve (IX. 33. iii; X. 33. ii) can be marked. This is responsible for the angular form of *la* of the first century A. D.

At Sāñchi we find a peculiar letter formation which has been read by scholars as *la*.¹ There is another letter, supposed to represent the same sound, found at Mathura. Bühler reads the word, in which the letter is used as *kālavāla*.² The Sāñchi *la* is something like ζ ; and the Mathura one is like ω . Dani,³ however, derives these letters from the Brāhmī letter *ṭa*. But this is not acceptable. Dani probably mistook the upper vertical of Sāñchi *la* for the part of the *i* medial, and hence derived this letter from Brāhmī *ṭa*. This formation does not explain the upper vertical of Mathura *la*. In our opinion this letter closely resembles the letter *ḍa*. (cf. IX. 18. ii) and must have been derived from this letter or Aśokan *ra* which is formed by a dot put under the letter *ḍa*. Phonetically also this is closer to the letter *la* which was later confined to the South Indian languages.

Dani ...	(ṭa)	⊂	(la)	ζ	Sāñchi
	(ṭa)	⊂	(la)	ω	Mathura
Our theory	(ra)	ṛ	(la)	ζ	Sāñchi
			(la)	ω	Mathura

1. Majumdar, N. G., *MS*, pl. CXXXI, No. 187.

2. Bühler, *El*, Vol. II, Pl. opposite p. 379, No. 33.

3. Dani, *IP*, p. 54, fig. 6. viii, and p. 55.

The dot in the Aśokan *ra* probably took the form of the lower tip in the Sāñchi *la* and was again elaborated in the Mathura specimen.¹

The lower circle of the letter *va* does not retain its perfect round shape; rather it varies (Pl. III, line 35). But finally it settles down to a triangular base form (VIII. 33. i, iv). At Sāñchi, we find a peculiar formation of this letter. Instead of a circle or a triangle, a square is appended to the vertical (IX. 35. ii). But as we shall see in the next chapter, this form did not get the approval of writers in general, because a triangular *va* was a logical outcome of a letter with circular appendage. Medial signs are added in the conventional way.

The first letter of the Barli fragmentary inscription has been read as *vī* by Haldar,² and D. C. Sircar suggests it to be a compound letter *dva*³ (XIV. 35. ii). But both readings are hardly convincing. We never find an *i* medial turned to the right (see above pages 14-15, Chapter I) and there is no reason to place this inscription in the fourth-fifth century B.C., only on account of this doubtful reading,⁴ because 'its palaeography otherwise belongs to the first century B.C.'⁵ And on the other hand the suggestion of Sircar is also not acceptable because, in the words of Dani, 'the form of *da* opening on the right is not seen in this period save for the exceptional script of Bhaṭṭi-prolu.'⁶ We agree with Dani that 'in its fragmentary nature it is difficult to suggest any definite reading'.

1. Also cf. Upasak, *op. cit.*, p. 74 and Bühler, *IP*, pp. 30 & 55. However, Bühler's derivation of this letter from *ḍa* is also not fully justified as we have Aśokan *ra* to explain its formation. Ofcourse, Aśokan *ra* itself is derived from *ḍa*.

2. *IA*, 1929, p. 229.

3. *JBRS*, 1951, p. 35.

4. *IA*, 1929, p. 229.

5. Sircar, D. C., *JBRS*, 1951, p. 36, however, assigns it to the same date as the Bhilsa inscription of Bhāgavata.

6. Dani, *IP*, p. 54.

Sibilants & *Ha*

The letter *śa* in the Ghosundi inscription (XII. 36. i-ii) is somewhat angular while on the coins it has developed into a curved form. But the letter *sha* is met with in its advanced form with almost equalised verticals and angularised form on the coins (VIII. 37. i) as well as in the regular inscriptions (XII, 40. iv). These letters occur less frequently.

On the contrary, the letter *sa* is used most frequently and it exhibits many variations of form. Here we prefer to classify this letter into two main types, viz. curved hook type and angular-hook type. The former is the same as found in the earlier periods while the latter type is a developed form. There is also a tendency to equalise the verticals and this is to be seen specially in the latter type (VII. 38. ii-iv; IX. 38. ii; X. 38. ii etc.). The medial for *o* is a single line as well as two separate strokes. Similarly the *u* medial is appended to the middle of the hook as well as in alignment with the right vertical, as in the letter *pa*.

Like the letter *sa*, *ha* also can be classified into two main types, curved and angular (Pl. III, line 39). The angular type represents a more advanced form and is generally found on the coins (VII. 39. i-ii). But it can be seen in inscriptions also (X. 32. i; XI. 39. i, iv). The medials are added in the conventional way.

COMPOUND AKSHARAS

The compound letters are very interesting in this period. Very often a certain amount of immaturity and uncertainty is marked in combining two letters. For example, a combination of letters *ba* and *ra* is most significant for two reasons; firstly the secondary letter *ra* is shown by a simple vertical line and not by a serpentine line, and secondly, it is sometimes added in the middle of the letter *ba* (VIII. 40. iv and XI. 40. iv) and sometimes shown by extending the right vertical downwards

(VIII. 40. v). This creates confusion because the same techniques are adopted for adding *u* medial to this letter (see above p. 73). Similar confusion exists in the combination of *na* and *ha*, and *ṇa* and *ha*. The letter *ha* joints *na* at different points. It may touch the right half of the base of the letter *na* either at the right end (IX. 40. iii; XI. 40. iii) or in the middle (IX. 40. ii) and sometimes the middle vertical is extended downwards to form the left vertical of subscript *ha*, , which might easily be read as a combination of *ka* and *ha* (X. 40. i); a difficult combination. The uncertainty of the combination of *ha* and *ma*, or *ma* and *ha* is also remarkable (VIII. 40. vii and XI. 40. v). Probably this is due to the peculiarities of pronunciation. The same word was perhaps pronounced by some as *brahma* and by others as *bramha*. The letter *ha* is added to *ma* either at the bottom of the circle (XI. 40. v) or to the right of it (XI. 40. vi).

The combination of *ra* with other letters is also very interesting. During the period of Aśoka, the combination was uncertain. As a rule the letter pronounced first was placed above the letter pronounced next. But in Aśokan inscriptions, we notice that sometimes *ra* finds the upper place even when it was not intended to be pronounced first, for example, *trai*  ; *rva* or *vra*  etc. On this point, Upasak observes :

“When these signs are closely examined, it is evident that no uniformity was maintained in attaching them. The extra stroke sometimes appears at the top, sometimes below and sometimes even in the middle. Its direction is also not definite as it goes at some places to the right, and other to the left. How can there be so many signs for a particular letter ? For instance, in REJ. —I. 2, a shape thus—  is read by Hultsch as *dra*, while in the next line stroke for *R* comes below—  . In later ages, the use of *R* is very frequent; its form in combination is uniform and its sign is very distinct. In all probability these signs, accepted as *R*

by Hultzsch, are errors, mostly on the part of the engraver".¹

It is clear from the above passage that Upasak holds two persons responsible for this; firstly the decipherer, Hultzsch,² and secondly the engraver. But actually neither of them was responsible. This and many similar errors were to be expected from the Brāhmī writing when it was in its primary stage during the time of Aśoka. In the period under study, the indefiniteness and uncertainty was not over and traces of this can be seen in the combination of the letters, though considerable stability was gained by this time. The letter *ra* was added to the right half of the initial letter, and if intended to be pronounced before a letter, it was placed above that letter, e. g., *rsha* (XII. 40. iv). Mostly this letter was in the serpentine or the so-called cork-screw form, but in some cases it was a straight stroke, e. g. *ra* in *bra*. At one place, on a coin, *ra* in *tra* is shown by slightly bending the right leg of *ta* (VIII. 40.iii). The letters *kra*, *dra*, *dra*, *tra*, *pra* etc. are as usual. In this period we come across combinations like *bhyām* and *rsha*, which are due to the fact that Sanskrit also was being attempted in this script. This fact necessitated the addition of many new signs in Brāhmī.

In this period we notice some other peculiarities also. At Sāñchi on a pavement slab (Marshall, *MS*, pl. cxxx iv. 17) we find an example of reversed writing. This short inscription reads from right to left except the last word, *dānam*, which reads in the usual way. This can be nothing but the fancy of the writer. Such enthusiastic expression can be seen in the double-lined letters of the two ground railing inscriptions of Stūpa II at Sāñchi (Marshall, *MS*, pl. cxxxvi. 9 & 11).

Some letters have also been found with peculiar shapes. At Sāñchi we notice a letter which resembles *ga* but has been

1. Upasak, *HPMB*, pp. 120-21.

2. *Ibid*, p. 120.

read as *kha* (*pokhareyakasa*, Marshall, MS, pl. cxxxvi. 25). On a casket found in Stūpa No. III at Sāñchī (Marshall, MS, pl. cxxxx. s) we see that the upper vertical of *bha* is attached to the left instead to the right. Similarly some peculiar forms of the letter *ma* can also be noticed in the figure below :

Some peculiar combined letters.

- I. *Bra* 𑀧 , 𑀨 compare *Bu* 𑀧 , 𑀨
 II. *tra* 𑀭 , 𑀮
 III. *mha* 𑀭 . 𑀮 *hma* 𑀭𑀮
 IV. *nha* 𑀭 , 𑀮 , 𑀯

Peculiar medials

- I. *ā* 𑀅
 II. *i* 𑀆

Some peculiar shapes :

- I. *ma* 𑀭 , 𑀮 , 𑀯 , 𑀰
 II. *bha* 𑀧
 III. *kha* 𑀧

In an inscription on the railing of Stūpa I at Sāñchī we find that a slanting stroke has been used for the *i* medial (Marshall, MS, pl. cxxviii. 18). In another inscription at Bhārhut (Cunningham, *Stūpa of Bhārhut*, pl. lvi. 45), *ā* medial has been put to the left of the letter *ma* instead of right.

In a casket inscription of Stūpa III (Marshall, MS, pl. cxxxx. r), we see a peculiar spelling for the word *dhitu* (daughter). Instead of writing it with the letters *dhi* and *tu* it has been spelt as *di + hi + tu*.

With all these remarks it can be said that experiment was still going on during this century and writing was still unconventionalised. Some elements of uncertainty were still present in the Brāhmi script. But as compared to the time of Aśoka it had considerably advanced and it was gaining the capacity to write the Sanskrit language also.

-

Until the close of the first century B. C., the Brāhmi script developed uninterrupted on the old traditional lines established during the time of Aśoka. Its growth was very slow and to some extent it was static. The tool and the technique of writing was almost the same as used in the Aśokan inscriptions. The changes which had taken place so far were mainly due to the fact that the art of writing was becoming known to more and more persons with increased chances of introducing individual mannerisms and personal habits. This and the teacher-taught traditions paved the way for freaks, seemingly developing into regional traits. But by the close of the first century B. C. the Śakas established themselves in north-west India and they introduced some revolutionary changes in the art of writing Brāhmi script. We have observed earlier that the tendency to equalise the verticals of letters like *pa*, *la*, *sha*, *sa* and *ha* and to angularise the curves had already started during the first century B. C. This change was led by the coins (Table VIII of Plate III), obviously influenced by the Greek lettering. The Śaka Kshatrapas used an edged pen for writing which gave a new face to the Brāhmi letters, producing an effect not dissimilar to Greek lettering. Dani rightly observes that 'this was not an isolated phenomenon' and 'the well known use of square omicron on the Śaka and Parthian coins' can be related to

CHAPTER V

THE ROLE OF THE SAKA KSHATRAPAS

(Early Ist
Century A. D.)

this.¹ The inscriptions of the Kshatrapas of Mathura are well marked for their neat and well formed letters. During this period individual letters got special treatment, the main attention being given to the top of the letters. The triangle-like formation at the head of the letters *ka*, *va*, *la*, *va* etc. was not deliberate, but it was produced by the skilful wielding of the new writing tool. This top triangle became so popular that very soon it was imitated by less skilled writers, giving an entirely new shape to some letters, e. g., *va* (Plate IV, Tables XVII and XVIII, line 34). These of course, could not get popular acceptance. Besides this top formation, the verticals of the letters were equalised and angularised in a very elegant manner. The *i* medial took a beautiful long flourish. Some other letters also got new shapes which will be discussed in detail below. This new technique received wide acceptance and was known in various degrees of perfection throughout the sub-continent within a half century. Another contribution of this 'new-pen-style' was that hence onwards the growth of the script and the changes in it were more rapid. The first century A. D. is the most important period of the history of the Brāhmī script simply because the changes introduced at the beginning of this century proved to be a turning point, paving the way for accelerated changes and consequently developing into regional scripts. For the first four centuries of its history, the Brāhmī script remained practically the same for the whole sub-continent. But by the end of the fourth century A. D., script-wise India was split up into many regional pockets. One should not think that only the 'new-pen-style' was responsible for all this. There were other factors also which brought about the changes, and we will deal them in some detail in the next chapter. Here we would only like to emphasize that this new style of writing, was but an important beginning of future changes.

In the latter half of the first century A.D., the Kushānas became politically important in Northern India and Kanishka

1. *IP*, p. 52.

started the tradition of systematically dated inscriptions which was also followed by his successors. Such a system of reckoning became so popular that the rulers of Kauśāmbī, Bandhogarh (Rewa) and other places started dating their inscriptions in this era. It has been suggested that these eras may be the same as the era used by Kanishka and his successors.¹ Though the problem is far from settled it is believed by a majority of scholars that the Śaka era beginning from 78 A. D. is the same as that which was started by Kanishka.² The inscriptions of Kanishka and his successors will form the subject matter of the next chapter. In this chapter we will take up and analyse only those inscriptions which are considered pre-Kushāna.

A. Führer assigns the two Pabhosa inscriptions to the second or first century B. C.³ But a comparison of these with the Kshatrapa inscriptions of Mathura leaves no doubt about their belonging to the first century A. D. On the same considerations the Ayodhyā inscriptions of Dhana(deva) can also be placed in this century.⁴ These two sets of inscriptions clearly show the use of the 'new-pen'. The Bhārhut *torāṇa* inscription of Dhanabhūti mentioning *suganam-raje*⁵ and the Bodh-Gaya

1. Dani, *IP*, p. 90.

2. Sircar, D.C., *The Age of Imperial Unity*, pp. 143-44.

3. *EI*, II. 243.

4. Cf. Sircar, D.C., *SI*, p. 80, fn. 1.

5. Cunningham, *Stūpa of Bhārhut*, p. 128, pl. liii. 1. Prof. A. L. Basham, while going through the typescript notes, 'Without referring again to the actual inscription I can't be sure, but to put the Dhanabhūti inscription in the first century A.D. involves many chronological difficulties, and I must admit I'm doubtful'. Here I want to point out that the Śunga dynasty was ruling in Ayodhya in c. 1st century A.D. is clear from the Ayodhya inscription of Dhana (deva) and therefore the mention of the Śungas in the Bhārhut *torāṇa* inscription of Dhanabhūti is not entirely unexplainable because they might have held their nominal sway over this area through some feudatory, if not directly. R. P. Chanda also accepts the *torāṇa* inscription to be of a later date than those on the railings of the Bhārhut stūpa. (cf. *Mem. A. S. I.* No. 1. pp. 14-15 and also *supra* pp. 58-61).

inscriptions on the fragmentary railings¹ are probably written with the traditional pen, but the treatment of some letters like *va*, *ha*, *pa*, *ra* etc. (specially in the Bodh-Gayā inscriptions) and the long flourish for the *i* and *ī* medials indicate that the script of these inscriptions is too advanced to be confused with the older types. This can be assumed to belong to the transitional period when the use of new pen style was known but not introduced in the eastern parts of northern India. There is a marked difference in the palaeography of the Bhārhut toraṇa inscription of Dhanabhūti I and the Mathura inscription of Dhanabhūti II.² According to Cunningham³ Dhanabhūti II was the grandson of Dhanabhūti I. The vast difference in the characters of these two inscriptions is not due to a long gap of time between their issuers but due to the differences in the local writing traditions of these two places; Mathura being more informed about and susceptible to the new changes while in the east old practices persisted.

In the western region Sāñchi and Mathura were the two most important places from the viewpoint of writing activities, the latter gaining accelerated importance every day. From Sāñchi the inscriptions on the Stūpa III, the East, South and West gateway inscriptions of Stūpa I, the relic casket inscriptions from Stūpa I and some inscriptions from the railings of Stūpa I (Marshall's Nos, 90, 283, 322, 324 and 350) have been studied and analysed in Table XVI on plate IV. These are labelled as Series III and assignable to the 1st century A. D.

The inscriptions from Mathura are classified into two groups. One group is formed of those inscriptions which bear the names of the Kshatrapas and the other group consists of those which have been taken to belong to the pre-Kushāna

1. Cunningham, *Mahābodhi*, pl. X.

2. Cunningham, *Stūpa of Bhārhut*, p. 130 and Lüders, *Mathura Inscriptions*, p. 212, 187.

3. *Op. cit.*, p. 129.

period of the 1st century A. D. A list of the inscriptions consulted and analysed is given at the end of the chapter.

In the eastern region besides Bhārhut and Bodh Gaya Kalinga is also noted for its writing activities being carried over by the kings of Mahāmeghavāhana dynasty of Orissa. The Hāthigumphā inscription of Khāravela of this dynasty is one of the most disputed documents not only because of its contents but also for its palaeographical peculiarities. The main reason for this seems to be its irritably worn out condition which gave rise to several variant readings. A discussion of these does not fall within our scope and therefore we will take up only its palaeographical characteristics which, according to our analysis, indicate its belonging in the early 1st century A. D. This epigraph has variously been placed between the 3rd and 1st centuries B. C.¹ But we have reached early first century A. D. for its date not only on palaeographical considerations but also from some other ratiocination.

There are at least two considerations for determining the date of Khāravela. These are (i) the mention of contemporary kings and, (ii) references to era, if any, in his Hāthigumphā inscription. As regards the first there are three names of kings which could be desciphered with various degrees of satisfaction. Of these the reading of the name of Sātakarṇi only is beyond dispute. Of the other two names of *Bahasatimilam* and *Dimata*, very often identified with Demetrius the son of Eythedemus, the reading of the latter is extremely doubtful.² Considering the late date of this inscription and

1. *CHI*, p. 642 and pp. 481 ff. See also Sten Konow, *Acta Orientalia*, I, 1923, p. 12 ff., for various dates proposed.
2. Cf. Tarn, W. W., *GBI*, pp. 457-58. "In 1919 the late Dr. Jayaswal and the late Professor R. D. Banerji made a fresh examination of the rock, and Jayaswal announced that he had read the word Yavananārāja, followed by the proper name Dimata; he has stated that he found the syllable *-ma* clear and ultimately with great difficulty read Dimat (a). This reading, and its interpretation as the Greek king Demetrius, were accepted both

the doubts prevailing about the exploits of northern India by Demetrius and also the paucity of evidence to think of Mathura as his capital, it is impossible to arrive at any conclusion on this basis. Similarly the identification of *Bahasatimitam* or *Bahapatimitam* with Pushyamitra Śunga 'merely on the ground that Brīhaspati (Jiva) is the regent, *nakshatrādhipa*, of the *nakshatra* or zodiacal asterism Pushya, also named Tishya, in the constellation Cancer or Carb, cannot be regarded as final in the absence of more convincing evidence'.¹ In no case Khāravela could be regarded as 'a contemporary of Pushyamitra who ruled from about 187 to 151 B. C.'²

But the case of Sātakarṇi is worth considering who seems to be Sātakarṇi the First, the third king of the Sātavāhana dynasty, variously been assigned a date ranging between 3rd century B. C. to 1st century B. C. But the Purāṇas provide us with a definite clue as regards the date of the beginning of the Sātavāhana dynasty. In the Purāṇic lists of the future kings³ it is stated 137 years after the accession of Chandragupta Maurya the Śungas will rule for 112 years and then the Kāṇvāyanas for 45 years whose last king Suśarman will be killed by the Āndhra Simūka (also misspelt as Śisūka, Sindhūka, and Śipraka in the Purāṇas). Thus 294 years had

by Banerji and by Dr. Sten Konow. Konow, however, said of his own reading : 'I can see Yavanarāja, as read by Mr. Jayaswal, and of his Dimata the *ma* is quite legible'; he did not say if he could see the supposed faint traces of the rest of the word.....Jayaswal's version in 1927 was : 'On account of the report (uproar) occasioned by the acts of valour i. e. the capture of a fortress etc. previously mentioned the Greek king Demet (rios) drawing in his army and transport retreated to abandon Mathurā.' Then in 1928 Jayaswal puts forward a totally different view : what in the inscription refers to, he said, is the Greek king (he does not say Demetrius) being beaten off from Pataliputra when he attacked it and retreating to Mathura."

1. Raychaudhuri, H. C., *PHAI*, p. 374.

2. *Ibid*, p. 378.

3. Pargiter, *DKA*, pp. 70-71.

passed away after the accession of Chandragupta, say about 324 B. C., when the Sātavāhana dynasty was established by Simūka, a date which falls in 30 B. C.¹ Simūka is said to have ruled for twenty three years and his successor Krishṇa for 18 years (sometimes 10 years). Thus the date of Sātakarṇi, who succeeded Krishṇa, falls in c. 10 A. D. (c. 0 A. D.). We agree with Prof. Raychaudhuri that Simūka was for some years a contemporary of Suśarman (40-30 B. C.) and flourished in the first century B. C., but are hesitant to accept the view that his reign period be counted from sometime before 30 B. C., keeping in view that he established the Sātavāhana power after killing Suśarman in 30 B. C. Therefore it seems more probable that Sātakarṇi started his reign sometime in the beginning of the 1st century A. D. whose younger contemporary was Khāravela because in the second regnal year of the latter Sātakarṇi seems to be a big power.

The second consideration is the mention of some dates in this epigraph of Khāravela. In the line 16 of the inscription earlier scholars read and interpreted '165th year of Rāja Muriyakāla'.² But now nobody accepts the existence of a Maurya era in this inscription as the revised reading does not permit any such assumption.³ The second passage, which mentions some date, runs as follows in the sixth line of the epigraph : *Pañchame cha dānī vase Nandā-rāja ti-vasa-sata* o (ghā) *ītam Tanasūriya vātā pañādim nagaram pavesa (ya) ti*. Here Nandarāja has been taken to be a king of the Nanda dynasty of Magadh, and the expression *ti-vasa-sata* is either 103 or 300 years. However, there are good reasons for believing that this cannot mean 103 or 300⁴ years but rather three centuries. It should not be taken, as a matter of fact, 300 years in 'round number'. Some scholars have tried to count

this from 324 B. C.,¹ the supposed date of accession of Chandragupta Maurya, or two years earlier i.e. from 326 B. C.² 'when the Nanda dynasty may have been overthrown'. In our opinion this loose expression of 'three centuries' may be counted from any date in the late 4th century B. C. when Nandas were in power and might have invaded Kalinga, and does not effect the date of Khāravela who flourished in the early 1st century A. D. De la Vallée-Poussin maintains Khāravela to be 'apres, beaucoup apres 150', probably early 1st century A. D.³

As regards the palaeography of this epigraph it undoubtedly belongs to the 1st century A. D. We need not agree with Dr. Sircar who maintains that 'on grounds of palaeography, it is to be placed later probably than the Nānāghāṭ records and certainly than the Besnagar inscription of Heliodoros'.⁴ He further maintains about Sātakarṇi of the Hāthīgumphā inscription that 'This king seems to be that Sātakarṇi who ruled shortly after the husband of Nāganikā according to the Purāṇas. Palaeographically the Hāthīgumphā inscription is slightly later than the Nānāghāṭ records. It may be pointed out that the letters of the Sāñchī inscription of Sātakarṇi.....resemble the script of the present record and may belong to Sātakarṇi II. Of course, if this slight development is overlooked, we may identify both these Sātakarṇis with Sātakarṇi I. But it should be remembered that the big Nānāghāṭ record was possibly engraved after the death of that king'.⁵ It seems that Dr. Sircar is hesitant as regards the identification of the Sātakarṇis of the Nānāghāṭ and Sāñchī inscriptions simply, perhaps, because of the differences in the characters of the records. But once one realises the fact that in the remote areas older forms persist longer, there can be no difficulty in understanding the

5. Sircar, D. C., *op. cit.*, p. 215, fn. 1.

causes of the more advanced forms of the characters of the Sāñchi inscription on one hand and less advanced forms of the Nānāghaṭ inscription on the other. In Western India the Nānāghaṭ inscription of Nāgnikā is perhaps the first big inscription after those of Aśoka, and after this remarkable advancements can be marked which took place within a century during the reign of the Western Kshatrapas and the Sātavāhanas in this area. This can be explained as due to close contacts of this part of India, during this period, with the North as well as North-Western India. Similarly Orissa also was less informed of the new developments and kept adhering with the older forms for some time.

The characters of the Hāthigumphā inscription are analysed in Plate IV. A.

Table XV contains letters found on coins and seals which are considered to be of the first century A. D. The coins of the Kuṇindas, the Pañchālas, the Audumbaras and the Kshatrapas of Mathura and the coins from Kauśāmbī, Ayodhya and Almora have been assigned to this period. We find no palaeographic ground to assign some coins from Kauśāmbī, like that of Dhanadeva, and those from Ayodhya to a period after the Kushāṇas.¹ Absence of the Kushāṇa epigraphs in this area after Kanishka and the existence of the records of the Magha rulers of Kauśāmbī and Bandhogarh area are sufficient reasons to believe that the eastern portion of the Kushāṇa empire slipped away from the hands of the Kushāṇas soon after the death of Kanishka. The provenance of the coins of Vāsudeva from Kauśāmbī² also does not effect our scheme. However, the palaeography of coins is doubtful and too much reliance on it is risky. Many new Pañchāla and other coins have come to light and have been published in the volumes of *JNSI*. Some of them have been referred to here also. Some seals also have been considered and analysed. A seal from Kauśāmbī has been

- B. After sealing.

published by S. C. Kala¹ and referred to by K. D. Bajpai.² Both the scholars read the legend as *Vagīpalasa*. (see Fig.) The order of the letters does not permit this reading. The inscription is on a seal and is intended to be read after sealing. Dr. Bajpai overlooked this fact and has read it directly. If read after taking impression the seal clearly bears the name *Hathipalas*.

The characters of this seal may belong to the early first century A.D. A coin has been published by R. R. Tripathi in *JNSI*,³ bearing the legend *Hathiparasa* which he thought to be a corrupt form of *Hastipurasya* or *Hastināpurasya*. The reading of this coin may be revised as *Hathipalasa* and this person may be regarded as the issuer of both the antiquities.⁴

With these introductory remarks we will now take up individual letters and trace

1. *JNSI*, XXIV, p. 137, Pl. II. 12.

2. *Ibid*, p. 16, fn. 1.

3. Vol. XXIV, p. 20, pl. II. 1.

4. For more detailed discussion see author's article in *JNSI*, Vol. XXXI, pp. 143-50.

how far they have deviated from the older practice and evaluate how much they are responsible for the development which took place during the time of the Kushāṇas.

VOWELS

To begin with the vowels, at least six vowels are known to be used in this period. The vertical of *a* is usually a straight line with thick top-head except those which come from a remote area like Bihar and Orissa etc. Optionally, this is curved also, sometimes the lower end turning to the left (XVIII. 1. iv & XIX. 1. i.) and sometimes towards the right (XVIII. 1. ii). The left hand curves generally meet the vertical at one point but at Sāñchi III (XVI. 1. i.) Pabhosa (XIX. 1. i.), Bhārhut II (XX. 1. i.), Bodh-Gayā (XXII. 1. i.) and Orissa (Pl. IV. A. 1. 1. ii), they often touch it at two points. In a good number of cases the lower curve of *a* takes an additional inward curve, producing a beautiful effect. This is a Kshatrapa contribution. The medial sign for *ā* meets the vertical either at the middle or at the lower half. Very often the two curves at the left are equal in length to the vertical. But *a* with longer vertical is also found (XVII. 1. ii; XVIII. 1. iii, iv and XIX. 1. i.). This becomes one of the chief characteristics of the letter *a* during the following centuries.

The letter *i* is formed of three dots with the apex at varying points. One of the main developments of this period is the addition of a fourth dot in this letter. There are two clear opinions as regards the reading of this dot. Cunningham,¹ Ojha² etc. take the dot for *anusvāra*, while Bühler³, Dani⁴ and others regard it a sign for long *i*. Dani gives no reason for it but Bühler argues like this; 'Though this (Cunningham's) reading is possible, I consider it improbable, as it

1. *Mahābodhi*, p. 15.

2. *Prāchīna Lipi-Mālā*, p. 51.

3. *IP*, p. 52 and *EI*, II, p. 201.

4. *IP*, pp. 53-54.

would be necessary to assume for *i* a not traceable form, consisting of two dots side by side with a third dot above on the left, thus, $\begin{smallmatrix} \cdot \\ \cdot \cdot \end{smallmatrix}$.

This argument of Bühler is not convincing at all. An objective observation of this letter reveals that perhaps there was no fixed convention about the position of the dots. They could have been placed at the will of the writer. To make an *i* only three dots were needed irrespective of their position. An exactly opposite situation of the dots can be found in the Mathura stone bowl inscription¹ (XVIII. 2. i) where two dots are placed in a line side by side and the third one is below the left dot. Secondly, in one of the Bodh-Gayā inscriptions² the three dots of *i* are in a position with the apex at the top (XXII. 2. i) and the fourth dot is in the right upper portion of the letter. Thirdly, a single dot has never been used for any purpose other than to denote an *anusvāra*, never as a long *ī* medial. Fourthly, in every case the reading *im* gives sense, like *imda* or *imdra*, while long *ī* presents a peculiar conjunction like *īd* or *īdra*. Thus this fourth dot of *i* must be read as *anusvāra*.

The letter *u* continues its older form of an angle opening to the right (Plate IV, line 3 and Pl. IV A, line 2). Sometimes the top of the vertical is thickened (XVII. 3. i; XVIII. 3. i and XX. 3. i), and in many cases the horizontal line is shorter than the vertical one. In one of the Pabhosā inscriptions³ we find a letter resembling long *ū* (XIX. 3. i) the reading of which has been doubted.⁴ The letter is clearly a long *ū*.

We find one *e* which has its apex at the top (XVIII. 4. i). The triangle of *ai* in the Hāthigumphā has also its apex at the top (Pl. IV A. 4. i) while that of *e* is towards right (Pl. IV A.

1. *EI*, XIX, 68.

2. *Mahābodhi*, pl. x.

3. *EI*, II, p. 242, No. 1.

4. *Ibid*, fn. 10.

3. i). The letter *o* is formed by adding a horizontal stroke at the top of the left of the letter *u*. In many cases the letter seems to have been drawn in one stroke (XVIII. 5. i, ii). On coins it takes a more cursive shape (XV. 5. i).

CONSONANTS

SIMPLE AKSHARAS

Gutturals

In this period the vertical of *ka* was lengthened; in some cases the top-head being a triangular one. Dani¹ observes that 'this top-head formation was deliberately done. It was implied in this new process of writing itself'. This is true for the skilled writers only. This triangular head became so popular that less skilled writers started making it deliberately. As a result of this we find peculiar forms of some letters, e.g., *va* (XVII. 34. iii-vi; XVIII. 34. i-iv etc.) and *ta* (XVIII. 20. iii, vi) with hollow head-marks in various stages. Such a formation of *ta* was accepted at later stages in some areas, though it developed through line-head mark, while in the case of *va* the hollow head did not get popular support. We will take up this point later while dealing with these letters. Returning to *ka*, we may observe that the horizontal cross is a straight line in many cases, but sometimes it takes the form of two downward slanting strokes (XVIII. 6. iii) which became a characteristic of later periods. The head-mark of this *ka* is also noteworthy, especially in the Hathigumphā inscription (Pl. IV A. 6. i).

The shape of the letter *kha* is entirely changed, due to a triangle being appended to it instead of a dot or circle. Though occasionally we find *kha* with a dot (XVI. 7. i. Pl. IV A. 7. i, ii), the triangular *kha* becomes most popular. The hook of this letter is also shortened (XVIII. 7. i, ii; XV. 7. i), though in Bodh-Gayā it is longer (XXII. 7. i). This letter seems to have been written in one stroke without lifting the pen .

1. *IP*, p. 52.

The angle of *ga* changes into a fine curve (Pl. IV, line 8) while the curved form of *gha* became angular (Plate IV, line 9 & Pl. IV A, line 8). The outer vertical of *gha* are equalised, but the middle vertical varies in size. In some cases it is equal to the outer verticals, (XV, 9. i, II) but in others it is shorter (XV, 9. iii; XVI, 9. ii; XVII, 9. ii, iii; XVIII, 9. i). In one case the middle vertical is longer than the two outer ones (XVIII, 9. ii), but this is by no means a representative example. At Bodh-Gayā and Hāthigumphā the left vertical is longer than the other two (XXII, 9. i and Pl. IV A 9. i) which reminds us of the earlier *gha* with its flat base.

Palatals

The letter *cha* in Bhārhut (XX, 10. i); Bodh-Gayā (XXII, 10. i) and Sāñchī III (XVI, 10. i, ii) represents the earlier *cha*, though the Sāñchī III ones are more advanced than the former two. The loop of *cha* develops into a rough quadrangular form (XX, 10. i, XVII, 10. i and Pl. IV A, 10. ii) and takes circular (XVIII, 10. i) and oblong (XVII, 10. ii) shape and finally develops into a beautiful crescentic loop (XVIII, 10. ii). Its vertical also is gradually shortened and then disappears, leaving a triangular head-mark (XVIII, 10. ii). But this is not the final shape which it takes in the later periods. Its vertical persists throughout, only disappearing occasionally.

Though *chha* with bisected circle appears in this period (XVII, 11. ii and XX, 11. ii), a double-looped *chha* becomes the standard form (XVI, 11. i, ii; XVII, 11. i; XIX, 11. i, XXII, 11. i and Pl. IV A, 11. i). The vertical of this letter is also reduced and in some cases has a thick triangular head-mark (XIX, 11. i).

The curved *ja* (XV, 12. ii; XVII, 12. i; XVIII, 12. ii; XX, 12. i, ii and XII, 12. ii and Pl. IV A, 12. ii) continues side by side with the angular ones (XV, 12. i; XVII, 12. ii; XVIII, 12. i and XXI, 12. i). In angular *ja* the vertical is generally straight, though at Ayodhya, Bodh-Gayā, and Hāthigumphā it

is curved. They stand half-way between the angular and the curved ones.

The letter *jha* is rarely found and continues its older form with minor differences which were due to the 'new-pen' (XVIII. 13. i, ii), and the same is true also for the letter *ṇa* (XIX. 14. i; XX. 14. i).

Linguals

The semi-circle of *ṭa* (XVIII. 15. i, ii; XXII. 15. i) and the full circle of *ṭha* (XVI. 16. i; XVII. 16. i) continued. The influence of the 'new-pen' is clearly marked in the letter *tā* of the Gaṇeśhrā inscription of Ghaṭāka.¹ But the letter *ḍa* becomes more slanting and cursive. Its top vertical is shortened and the lower one is lengthened and slightly curved towards the right (XVII. 17. ii. iii). The letter *ḍha* (XIX. 19. i) is also marked with a triangular top-head and the tip of the loop turns into a circle at the end. *Ṇa* continues the older form. In some cases the lower and the upper horizontal lines are curved (XIX. 19. ii, Pl. IV A. 16. i). This is an advanced form of this letter.

Dentals

The letter *ta* mostly continues its curved form, though at Bhārhut II an angular form is also to be seen (XX. 20. i, ii). The triangular head-mark (XV. 20. i; XVI. 20. ii; XVIII. 20. iv; XXI. 20. i. Pl. IV, A. 17. i, ii) seems to be standard in this period. *Ta* without any head-mark (XVI. 20. i) also continues. In some cases *ta* with line-head mark is also noticed (XVIII. 20. i, ii). But the triangular head-mark seems to have become so popular that in its imitation hollow marks were added to this letter (XVIII. 20. iii & vi). This is somewhat different from the well known box-headed variety of Central Indian script²

1. *ASI, AR*, 1911-12, pl. LVIII. 17.

2. Cf. *CII*, III, pl. xlv.

where the main letter is appended to the box-head by means of a vertical line. In this case it can be nothing more than an attempt to initiate the triangle head-mark. In the latter example cited above (XVIII. 20. vi), the shape of the hollow mark is almost triangular, while in the former it is a crude square. The main letter is directly appended to it without a vertical. We find one more *ta* without vertical (XVIII. 20. v), to which two strokes of *o* medial are attached starting from the curve of *ta*.

A circle with a dot in the centre makes the letter *tha*. No change in this period has occurred except that which was necessary with the 'new pen', i. e., varying thickness of the circle (XVIII. 21. i, ii). The letter *tha* on the seal of Hathipāla¹ is somewhat peculiar in shape, (XV. 21. i), having a large triangle head-mark. This may be due to the fondness of the designs for the triangular head-mark. The peculiar shape of the letter *ha* (XV. 38. ii) in this seal also may be attributed to the same cause.

From the view-point of the development of the letter *da*, this period represents a transitional one. The older form of *da* with an opening to the left continues at Bodh-Gayā (XXII. 22. i), Ayodhyā (XXI. 22. i), Bhārhut I (XX. 22. i) Sāñchi III (XVI. 22. i-iii), Hāthigumphā (Pl. IV. A. 19. i-iii) and also in some Mathurā Kshatrapa inscriptions (XVII. 22. iv). The next stage of the development can be seen in the coin Series III (XV. 22. i, ii) and the Pabhosā inscriptions (XIX. 22. i, ii), where the lower vertical starts along with the lower portion of the curve and then takes a turn to the right. In the third stage of the development, the turning of the lower tip of the letter eliminates the middle curve opened to the left and opens a new curve to the right (XVII. 22. iii & v). The final development appears in the coins (XV. 22. iii & vi) and the pre-Kushāṇa (XVIII. 22. i-iii) inscriptions of Mathurā. The

1. *JNSI*, XXIV, pl. II, 12.

following figure will show these developmental stages at a glance.

There is nothing new in the letter *dha* (Plate IV, line 23). The letter *na* also continues its older form, occasionally exhibiting the use of the 'new pen' (XV. 24. i; XVIII. 24. ii etc.). In some cases the horizontal line takes a curve (XVIII. 24. ii-iv; XIX. 24. ii, XXI. 24. i-ii & Pl. IVA. 21. iii). This curve becomes more and more prominent in later ages and gives way to newer forms.

Labials

Though the attempt to equalise the verticals of *pa* was started in the first century B. C., the Kshatrapas completed the process and gave it a beautiful appearance (XVII. 25. i-iv). Usually the left and optionally both the verticals were marked with triangular head-marks and the curve disappeared in favour of angles (Cf. Plate IV, line 25). In some cases, at Sāñchī III (XVI. 25. iii) Bhārhut II (XX. 25. ii), the curve continues and the left arm remains longer than the right one (see also XVI. 25. i; XX. 25. i & XXII. 25. i, ii; XXI. 25. i), though in the latter cases the curve is angularised. In Hāthigumpha the right vertical takes an inward turn to give an appearance of *pha* (Pl. IVA. 22. ii).

The letter *pha* was also influenced by the 'new pen' (XV. 26. i & XVII. 26. i) though at Ayodhyā it is still curved, with its left vertical longer (XXI. 26. i).

Ba retains its square form, with minor change due to the 'new pen' (Plate IV, line 27 and Plate IVA, line 23).

The right hand vertical of *bha* was already straightened in the first century B. C. In this period this occasionally becomes longer also. Its left hand hook is slightly broadened and beautifully tilted (XVII. 28. iii and XVIII. 28. iii). The

use of the 'new pen' is marked in the varying thickness of the lines.

The letter *ma* of this period shows older forms as well as the most advanced forms met with only in the late first century A. D. At Sāñchī III (XVI. 29. i-iii) Bodh-Gayā (XXII. 29. ii) and Hāthigumphā (Pl. IVA. 25. i, ii.) the lower part of *ma* is a circle, whereas in the Mathurā-Kshatrapa (XVII. 29. i-iv) and pre-Kushāṇa (XVIII. 29. i-iii) inscriptions and also at Pabhosā (XIX. 29. i-ii), Bhārhut II (XX. 29. i), Ayodhyā (XXI. 29. i) and Hāthigumphā (Pl. IVA. 25. iii-iv), we find angular forms. We find a very advanced form of *ma* (XV. 29. ii),¹ on a coin of Amoghabhūti who has been assigned² to a date ranging from the first century B. C. to the third century A. D.

Semi-Vowels

We have observed in the earlier chapter that the wedge-shaped and crescented *ya* became rare and the double-curved *ya* was becoming popular. In the early first century A. D. crescented (XV. 30. i; XVI. 30. i, ii; XVII. 30. ii; XIX. 30. i & XXII. 30. ii) and double-curved *ya* (XIX. 30. ii; XXII. 30. i) are also met with. But the Kshatrapas of Mathurā developed a new form of *ya* in which the base of the letter was flattened (XVII. 30. i) This new type of *ya* developed out of the crescented (XVIII. 30. ii) as well as the double-curved (XIX. 30. ii, iii; XVIII. 30. iv) form, because we find both types of the broadened *ya*. The two together gave a new shape to this letter, produced by the 'new pen'. The middle vertical was also reduced and equalised to give good effect. All the three verticals of *ya* were given special attention. 'The left arm develops its line head-mark into a curl and finally into a loop, and the middle arm inclines to the left, while the right presses down-

1. CCAI, pl. XXIII, 1.

2. Sircar, D. C., AIU, p. 161.

wards to balance the loop in the left'.¹ The looped *ya* is to be found in the Kushāṇa and succeeding inscriptions. In this period the Ayodhyā *ya* (XXI. 30. i) presents the most advanced form.

The letter *ra* is mostly a straight vertical, occasionally with its lower tip turned to the left. At the top it has the triangular head-mark (XV. 31. i, ii; XVII. 31. i, iv; XVIII. 31. i etc.), but sometimes this takes the shape of a small line (XVI. 31. ii; XIX. 31. iii). The serpentine *ra* is also seen (XX. 31. i; XXII. 31. i). In some cases the *ā* medial sign is written in the same stroke without lifting the pen (XVIII. 31. ii).

The curve of *la* is perfectly angularised in this period though curved forms also persist. Its right vertical is somewhat lengthened; it is usually straight but optionally inclined towards left (XVII. 32. ii) or right (XVI. 32. i). The hook of the left arm also received special attention in this period, and took various shapes (XVII. 32. i; XIX. 32. ii, iii; XVI. 32. ii).

We have already discussed the letter *la* in the previous chapter² where we saw that it was developed out of *ṛa*³ and not out of *ṭa* as conceived by Dani.⁴ We have also pointed out that the main indication of its being derived from *ṛa* is the vertical of this letter. Here, in the Mathurā inscription,⁵ this letter has a triangular head-mark (XVIII.33. i). This is a very fine specimen of this letter. Bühler, to whom the credit of reading this letter goes, has confused in reading it in Kushāṇa inscriptions where he invariably takes this letter to be a conjunct of double *ṭa*. We will discuss this in the next chapter.

1. Dani, *op. cit.*, pp. 87-88.

2. *Supra*, pp. 75-76.

3. Cf. Bühler, *IP*, p. 55.

4. Dani, *IP*, p. 55.

5. *EI*, I, pl. opposite p. 397. No. 33.

Sibilants and *Ha*

Though *va* with its rounded lower circle still continues in this period in some cases (XVI. 34. ii; XX. 34. ii, XXII. 34. i, Pl. IVA. 29. i, iii), the triangular *va* became the standard form. Its vertical, though continued optionally, is also reduced to the extent of a triangular head-mark. As pointed above, this triangular headmark became so popular, and the replacement of the vertical with something else was thought so necessary, that the triangle was formed deliberately (XVII. 34. iii-vi; XVIII. 34. ii-iv). This gave a new look to the letter, altogether different from the earlier one. However, this form was soon discontinued as it could not get popular sanction. It is noteworthy that such forms appear in the Mathurā fragmentary pillar inscription of Śoḍaśa also.¹

The angular form of *śa* changed into a fine curved form, exactly in the same manner as in the case of *ga* (see Plate IV, line 35).

The letter *sha* continued its older form and we find no change except that its curve developed into fine angles (see Plate IV, line 36).

The verticals of *sa* are equalised in almost all cases, though at Bhārhut II (XX. 37. i-ii) and Bodh-Gayā (XXII. 37. i) the longer left vertical continues. In Hāthigumphā both forms are found side by side (Pl. IV A. 30). The main curve of *sa* is drawn in a single action and then a hook is added at the left. In the most advanced forms of this letter, the curve is angularised (XV. 37. i; XVII. 37. iv).

The curve of the letter *ha* is also angularised like *pa* and *sha* (see Plate IV, line 38).

Some Peculiar Formations :

We have already noted above some peculiar formations of the letters *ta* and *va* which were attributed to the fondness of

1. *Mem. ASI*, No. 5, pl. XXVI. b.

the writers for the triangular head-mark. But in one Mathurā inscription of an unnamed *Mahārāja Rājātīrāja* dated in the year 299 of an unknown era,¹ we find some abnormal forms of the letter *sa* and *ta*. Barring these exceptional forms, which are five in number, all other letters are normal and are attributable to the first century A. D. From Mathurā comes another inscription of a *Mahārāja*² dated in the year 270 of some unknown era. Lüders attributed this inscription to the same king *Mahārāja Rājātīrāja*,³ and assigned it to 'early Kushāna times'.⁴ Its palaeography is quite normal.

The letter *ta* of *ārhatana* in line 1, read by Bühler as a compound letter *nta*,⁵ has a triangular *va*—like formation appended to it (XVIII. 41. iv). Similarly there are four *sa* letters—*sarvasīdhana* in line 1, *savachchhare* in line 1, *sate* in line 1 and *sāvikā* in line 3, which also have such *va*—like appendages (XVIII. 41. v-vi). There are, however, two other *sas* in the second line in the words *māsa* and *divasa* which are quite normal. R. D. Banerji,⁶ referring to J. Ph. Vogel who suggested that these may be abnormal forms of the letter, due to the caprice of the mason, observes that the *ta* of *ārhatana* [*m*] must also similarly be regarded as abnormal.

COMPOUND AKSHARAS

In the period under reference, the following conjuncts are noticed in the inscriptions:

1. Groups with initial guttural:

(a) *ksha* (XVII. 39. i; XVIII. 39. i)

(b) *gra* (XVII. 39. ii)

1. *IA*, XXXVII, 34, pl. III, opposite p. 66.

2. Lüders, *MI*, p. 162-63, pl. on p. 305.

3. *Ibid*, p. 163.

4. *Ibid*, p. 161.

5. *IA*, XXXVII, 33.

6. *Ibid*, p. 34.

2. Groups with initial palatal:
 - (a) *jña* (XV. 39. i-ii; XIX. 39. i; XXI. 39. i)
 - (b) *jva* (XVII. 39.iii)
 - (c) *chchha* (XVIII. 39. ii)
3. Group with initial lingual:
 - (a) *ṭṭā* (XVII. 39. v)
4. Groups with initial dental:
 - (a) *tra* and *tre* (XV. 39. iii and 40. i; XVI. 39. i; XVII. 39. iv; XVIII. 39. iii; XIX. 39. iv; XXI. 39. ii; XXII. 39. i).
 - (b) (i) *ttra* and *ttra* (XIX. 39. i-iii).
 - (ii) *ttrā* (XIX. 39. ii).
 - (c) *tsa* (XVII. 39. vi).
 - (d) *dra* (XV. 40. ii; XVII. 39. vii; XVIII. 39. iv, v; XXII. 39. ii).
 - (e) *dvi* (XXI. 39. iii).
 - (f) *dhru* (XV. 40. iii).
 - (g) *nha* (Pl. IV. A. 32. i).
5. Groups with initial labial :
 - (a) *pta* (XV. 41. i).
 - (b) (i) *pra* (XVIII. 39. vi).
 - (ii) *prā* (XVIII. 40. i).
 - (iii) *pri* (XVII. 40. i).
 - (iv) *prī* (XVII. 40. ii).
 - (c) *brā* (XVII. 40. iii).
6. Groups with initial semi-vowel :
 - (a) (i) *rga* (XVIII. 40. ii).
 - (ii) *rcha* (XVII. 40. iv).
 - (iii) *rta* (XVII. 40. v).
 - (iv) *rdha* (XVII. 40. vi).
 - (v) *rma* (XXI. 40. i).

- (vi) *rya* (XVII. 40. vii).
- (vii) *rva* (XVIII. 40. iii).
- (viii) *rsha* (XVIII. 40. iv).
- (b) *lgu* (XXI. 40. ii).
- (c) *vri* (XVII. 40. i).
- 7. Groups with initial sibilants :
 - (a) *ſchi* (XVII. 40. ii).
 - (b) *ſva* (XV. 41. ii; XXI. 40. iii).
 - (c) *shka* (XVII. 41. iii).
 - (d) (i) *shthā* (XVII. 41. iv).
 - (ii) *shthe* (XXII. 41. i).
 - (e) *shya* (XXI. 41. ii).
 - (f) *sta* (XVII. 41. v).
 - (g) (i) *stha* (XVII. 41. v; XVIII. 41. vi).
 - (ii) *sthi* (XVIII. 41. v).
 - (h) *sva* and *svā* (XVII. 41. vii; 42. v).
 - (i) *sya* (XVII. 42. vi; XVIII. 41. i-iii; XIX. 41. i-ii; XXI. 41. iii).
 - (j) *hma* (XVII. 42. vii).

Some comments are required to explain a few of these combinations. We find the secondary *ra* sign in various forms. In some cases it is a straight line, as in *Sāñchī* III and *Bodh-Gayā*, while in other cases its lower tip is turned towards the left and rarely towards the right (XIX. 39. iv). For the secondary *ri*, a downward slanting stroke is added at the bottom of the letter *va* (XVII. 41. i). The initial *ra* sign is always a straight vertical line in a compound letter. The secondary *va* is always attached to the primary letter by its middle vertical.

Medial signs

The medial signs also developed side by side with the letters of this period. The horizontal dash of *ā* medial, though it continued in this period, becomes a slanting stroke, or some-

times is slightly curved (XVIII. 24. iii). Sometimes, as in the case of *rā* (XVIII. 31. ii), the medial is written along with the main letter in a single stroke. The *i* medial developed into a beautiful flourish, though its curved form is also seen. Its standard form generally inclines towards the left but in some ornamental forms it takes an outward turn (XV. 8. ii & 24. ii; XVIII. 29. iii etc.). The long *ī* medial is represented by two such flourishes which very often take a U or broadened V shape which are specially to be marked in the *Hāthigumphā* keeping in view its so-called early date assigned by earlier scholars (Pl. IV A. 6. iii; 30. iii). The *u* medial is represented in many ways. In a letter like *ma* it is attached to the bottom, while in *pa*, *sa*, etc., it is added in the alignment of the right vertical; specially in *pa*, it is most interesting where its lower tip is turned to the left. In *ra* it appears as a horizontal dash. For long *ū*, an additional stroke is added (XVIII. 25. iv and XIX. 25. iv). These are sometimes written in one movement of the pen. The medial sign for *e* is a horizontal dash attached to the left of the letter. This form continues at *Bhārhut* II (XX. 22. i) and *Ayodhyā* etc. But its advanced form is an upwards shooting stroke slanting towards the left above the head-mark of the letter (XV. 22. iii). Two strokes to the right and left separately mark the medial *o*. Sometimes a single line extending to the left and right of the vertical of the letter serves the purpose, e.g. *gho* (XVII. 9. ii); *po* (XVI. 25. iii), *bho* (XVI. 28. ii), *bo* (XXII. 27. i), etc. In advanced forms, the strokes become more slanting, and may emerge either from one point (XVIII. 20. v & XV. 9. ii-iii; XVII. 9. iii) or from two different points as in *bo* (XVII. 27. i). An additional third stroke to the *o* medial makes it *au* (XVIII. 35. iv). In *kau*, at *Ayodhyā* (XXI. 6. ii), it takes a beautiful form.

The *anusvāra* represented by a dot, takes various positions, above the letter (XVIII. 38. iv), to the right of the letter (XXII. 24. i) or to the upper right half of it (XXII. 2. i-ii; XX. 24. i) etc..

The *visarga*, shown in the form of two dots placed one upon the other, comes to the right of the letter (XXI. 20. ii; XXI. 24. ii).

Punctuation Marks

In the Mathurā inscription of the year 299, we find two small dashes placed one upon the other (XVIII. 42. vi). This sign occurs twice in the inscription, once in the second line after the numerals of the year and again in the fourth line after a word.¹ R. D. Banerji rightly regards it as a punctuation mark.²

Numerals

In these inscriptions, we meet signs for the following numerals :

- 1—(XVIII. 42. ia) 
- 2—(XVIII. 42. ib & XVII. 42. i)
- 9—(XVII. 42. ii. & XVIII. 42. ii)
- 10—(XVIII. 42. iii)
- 70—(XVII. 42. iii)
- 90—(XVIII. 42. iv)
- 200—(XVIII. 42. v)

The sign for 1 and 2 are one and two parallel strokes respectively, while the sign for 9 in one case roughly resembles an interrogation mark (XVII. 42. ii), and in the other resembles the compound letter *dra*. R. D. Banerji observes³ about the latter that it is similar to the other signs for the numeral 9, the only difference being that its lower tip turns to the right whereas in the normal forms it takes a left turn. The sign for 10 is a *ma* with its opening to the right. A symbol 𑀓 has

1. *IA*, XXXVII, 34 & pl. facing p. 66.

2. *Ibid*, p. 34.

3. *Ibid*.

been taken as the sign for the numeral 70. We will discuss this in detail in the next chapter, where we find some more signs for it. A circle with a cross inside it makes the sign for 90. An \bar{a} like formation represents the sign for 200.

Conclusions

It will appear from the discussions above that the period of the first century A. D., which is marked by the introduction of a new writing tool, opens new horizons for the future development of the Brāhmī script. Combined with the natural instinct for ornamentation and the necessity of the flow in the writing, it gave way to various developments which took place in the coming centuries and shaped the Brāhmī script into many regional varieties. This marks a turning point in the history of Brāhmī script.

CHAPTER VI

THE PERIOD OF ACCELERATED DEVELOPMENT

(From A.D. 78 to
A.D. 200)

By the time Kanishka appeared in Indian history, script was no longer a thing of the kings, their officers and their scribes. It was handled and popularised by a number of people. The truth of this statement can be realised from the fact that the number of official records of this period is much less than that of the individual ones.¹ One of the obvious consequences of this was that more and more writers emerged to make their contributions to the Brāhmī script. The individual habits, likes and dislikes, and methods of forming every letter developed several varieties. By now the writing appears to have become a necessity for which swiftness was counted as an additional quality. Out of this emerged cursive forms. In northern India, where writing activities were more intense than in any other part of the country, the writers were more interested in the swift flow of the hand than in symmetry or ornamentation such as we see in the inscriptions of Nagarjunikonda² and Bijayagadh.³ Places like Sāñchi, Mathurā, Kauśāmbī, Sārnath, Śrāvastī etc. developed into important centres of writing activity, soon producing their own styles. During the period under review the Brāhmī script of northern India can be recognised to have become divided into two distinct schools of east and west. Mathurā became a centre for the western

1. See bibliography at the end of the chapter.

2. Cf. *SI*, Pl. XL.

3. Cf. *CII*, III, Pl. XXXVI, Nos. B & C.

style while Kauśāmbi led the eastern regions. Even though the difference in these two schools was limited only to a few letters, the distinction is clear.

One notable feature of the inscriptions of this period in northern India is that most of them are dated. The inscriptions of Kanishka and his successors are reckoned in an era said to have been started in A. D. 78 by Kanishka.¹ The inscriptions of Kanishka are dated between the years 2-23, i.e. A.D. 79 to A.D. 101. He was succeeded by Vāsishka or Vashushka whose inscriptions discovered from Mathurā² and Sāñchi³ are dated in the years 24 and 28, corresponding respectively to A. D. 102 and A. D. 106. He may be identified with *rājana* Vaskushāna of the Sāñchi inscription of the year 22,⁴ who after the death of Kanishka appeared with full regal titles of *mahārāja rājātirāja devaputra shāha* Vāsishka in the Mathurā inscription of the year 24. He has also been identified with Vajheshka, the father of Kanishka II of the Ārā inscription of year 41⁵. It may not be true that he and his son Kanishka II ruled conjointly with Huvishka,⁶ because we find the inscriptions of Huvishka starting from the year 28. It may be that he was ousted by Huvishka from the Mathurā and Sāñchi region about this year, i.e., A. D. 106, and established himself in the western part of the Kushāṇa empire where we find his son Kanishka II ruling in the year 41 i.e., A. D. 119. If this is acceptable, the Kushāṇa empire may be assumed to have been split up for a short period and Huvishka had to concentrate his attention mainly on the western part. This explains the absence of Kushāṇa records in the eastern region, which was probably left uncared for and may have slipped away from the hands of

6. *Ibid*, p. 150.

the Kushāṇas.¹ The Wardak Bronze Vase² inscription of Huvishka of the year 51, i.e., A. D. 129, presents no difficulty to our suggestions because ten years time would be sufficient to quell the rebellion. The rebellious nature of Vāsishka can be suggested from the Sāñchī inscription of year 22, where he assumes the title of king and does not mention Kanishka as his overlord as was done by others like Mahārāja Māsyaguta, a contemporary feudatory of Kanishka, in the Curzon Museum inscription of the year 23.³ It may be noted here that in his old age Kanishka seems to have engaged himself in 'an unfortunate expedition in the north, probably against the Chinese in Central Asia'.⁴ Kanishka's failure may have inspired Vaskushāna to usurp power and assume full regal titles.

The inscriptions of Huvishka range between the years 28 and 60, i.e., A. D. 106 to A. D. 138.⁵ The Kushāṇa inscriptions bearing the name of Vāsudeva range between the years 64 (or 74 ?) and 83, and, therefore, he can be assigned a reign up to A. D. 161, though other inscriptions of the Kushāṇa series date up to the year 98, i.e. A. D. 176.

Apart from the inscriptions of the Imperial Kushāṇas, we also find inscriptions of other kings dated in some unspecified era. The inscriptions of the Magha kings of Kauśāmbī and those of mahārāja Bhimasena and the rulers of his line from the Bāndhogarh area are dated in the era believed to be the Śaka-kāla started by Kanishka in A. D. 78.⁶ Another inscription, found from Kailvan (Bihar), also bears a date which

5. *Ibid*, p. 155, fn. 1.

6. Cf. also Krishna Deva, *EI*, XXIV, 155, for the era used by Magha rulers; and Chakravarti, N. P., *EI*, XXXI, 174-76 for the dates used by the Magha and Bandhogarh rulers.

according to Sircar¹ is in the Śaka era of A. D. 78. The palaeography of these inscriptions confirms the identification of the eras as Śaka, but it is not easy to agree with the suggestions of Sircar that the use of Śaka era indicates that Bihar formed a part of the Kushāṇa empire.² Dani rightly observes that 'the use of this era in no way implies the subordination of the rulers of Kauśāmbī to the Kushāṇas, but merely shows the continuation of a system of dating that was made popular by Kanishka in this region'.³ The absence of Kushāṇa records in the eastern regions after Kanishka suggests that these parts soon overthrew their Kushāṇa rulers. The Kushāṇa method of mentioning the day and the season was never copied by these rulers.⁴

For our study we have selected those dated inscriptions which may be placed before A. D. 200.

Dani rightly observes that it is not possible to speak of a uniform Kushāṇa style as applicable throughout their empire during their rule.⁵ Some particular writing styles were developing in certain localities and the Kushāṇas preferred to employ local writers for their records. It is due to this reason that we find the eastern and western varieties of some letters in the Kushāṇa records. The Brāhmī script was thus given a chance to develop in two respects, that is to say, in time and space. With this consideration in mind we have classified the selected inscriptions according to regions and arranged them in convenient groups.

The inscriptions from Mathurā and its surroundings including those of Sāñchī region, form one class and are labelled as Western Style (Plate V). These are further classified into

1. *EI*, XXXI, 230.
2. *Ibid.*, p. 231.
3. *IP*, p. 90.
4. *EI*, XXXI, 176 also fn. 3.
5. *IP*, p. 78.

'Official' and 'Private' groups. The official group contains those inscriptions which bear names of the Kushāṇa kings while the private ones do not. We are aware of the difficulties of such a nomenclature, because all the inscriptions having the name of a Kushāṇa king are not official in the strict sense of the term, but this seemed to be a convenient name as opposed to the private. Some official records are very well written and exhibit the skilled hand of the royal scribes, while the private ones show a variety of hands - skilled and unskilled. These are further analysed and arranged into tables. The tables under the Western Style are arranged as follows :¹

Table No. XXIII The Mathura inscriptions mentioning Kani-shka, dated between the Śaka years 5 and 23. This includes the Mat statue inscription of Kanishka, which is undated.

Table No. XXIV The Mathura and Sāñchi inscriptions mentioning Vāsishka and Huvishka, dated between the Śaka years 24 and 60.

Table No. XXV The inscriptions mentioning Vasudeva, dated between the Śaka years 64 (74 ?) and 83.

Table No. XXVI Private inscriptions from Mathura dated between the Śaka years 4 and 22.

Table No. XXVII Private inscriptions from Mathura dated between the Śaka years 25 and 98.

Table No. XXVIII The Sāñchi inscription of Vaskushana dated in the Śaka year 22. This inscription deserves a separate palaeographical treatment because of its advanced nature and

1. A complete list of references of the inscriptions utilised can be seen at the end of the chapter. The numbering of the Tables continues from Plate I.

peculiar forms of some letters like *sa* and conjuncts *sku* and *sya* etc.

The inscriptions of the Eastern Style analysed and arranged on Plate VI are as follows :

- Table No. XXIX The inscriptions mentioning Kanishka dated between the Śaka years 2 and 19 from Sarnāth, Kosam and Śrāvastī.
- Table No. XXX The inscriptions of Kushāṇa times from the eastern region.
- Table No. XXXI Two Mathura inscriptions of Kanishka, dated respectively in the years 4 and 14.
- Table No. XXXII Mathura inscription of Huvishka, dated in the year 33.
- Table No. XXXIII Inscriptions from the Kosam, Bāndhogarh and Bihar regions.

The last table, including the inscriptions of Bhīmasena and his successors from the Bāndhogarh area, dated 51 and onwards, shows the mixed style which is also influenced by the styles of Mathura and the south¹. But as the majority of the letters resemble the style of the Kosam region, this group is included in the Eastern Style.

The inscription of the Kanishka year 14 is one of the most disputed records of the Kushāṇa history. Various scholars have reacted in various ways to its palaeography. We will quote here some of their views. D. R. Sahni observes :²

‘The characters used belong to the Brāhmī alphabet of the Kushāṇa period. It must, however, be noted that the *m* everywhere shows the advanced form of the Gupta

1. Cf. also Dani, *IP*, p. 91.

2. *EI*, XIX, 96.

period with a small knob attached to the left of the letter instead of the triangular base. Similarly the *akshara* 'h' assumes the form peculiar to the eastern variety of the Gupta script in which the horizontal base-stroke is completely suppressed, the hook of the *akshara* being sharply turned to the left. The *anusvara* is throughout represented by a short horizontal stroke instead of the usual dot'.

N. G. Majumdar¹ holds that palaeographically it is impossible to refer this inscription to Kanishka I, that is to say to the early Kushāna period, as its alphabet shows predominantly 'Gupta' forms.

On account of the advanced form of some letters in this inscription, its date has been doubted,² and several synchronisms have been suggested leading to the existence of many Kanishkas and of 'the Kanishka legend.'³

Very recently, one more inscription from Mathura has come to light which is dated in the fourth year of mahārāja Kanishka, and bears, to quote D. C. Sircar, 'the so-called eastern Gupta variety of the letters *ma* and *hi*'.⁴ Sircar assigns this inscription to Kanishka I and places it in A. D. 81—82.

The Mathura inscription of Huvishka of the year 33 also bears some advanced forms of the letters *ma* and *sa*.⁵

Our analysis on Plate VI (Tables XXXI, XXXII & XXXIII) will show that we need not go as far as the 'Gupta'

1. *EI*, XXIV, p 148. fn. 4.

2. Please refer to the discussion on pp. 70-71 of B. N. Puri's *IUK*.

3. Sircar, D. C., *AIU*, p. 146.

4. *EI*, XXXIV, p 9.

5. Cf. the Plate in the *EI*, VIII, facing p. 182.

characters to explain these peculiarities. As suggested by Dani,¹ these peculiarities 'can be explained' by placing them 'side by side with the inscriptions from the Kosam region'.

If the authorship of Mathura inscription of the year 4 can be attributed to Kanishka I, and if the Mathura inscription of Huvishka of the year 33 may be assumed to refer to the same Huvishka whose inscriptions date between the years 28 and 60, without the necessity of postulating the existence of another Huvishka, why should a second or third Kanishka be imagined simply on the basis of the palaeographic peculiarities of some letters in the inscription of the year 14? We will discuss these peculiar letter formations while dealing with the letters individually, but we want to emphasize here that, on palaeographic grounds only, a third Kanishka need not be introduced and the reading² of the date in this inscription also should not be doubted. On epigraphic evidence, we can think only of two Kanishkas; Kanishka I as the founder of the Kushāṇa glory, and Kanishka II, the son of Vajheshka of the Ara inscription of the year 41.

Palaeographic Contribution of the Period :

The Brāhmi script of the first century A. D. exhibits a very rapid and varied growth, especially in north India. No doubt the introduction of a definite pen-style by the Mathura Śaka Kshatrapas was responsible for it to some extent, but the main credit of this development should go to the people who

1. *IP*, p. 79.

2. Cf. Puri, B.N., *op. cit.*, p. 71, who claims to have examined the estampage and the original inscription and found that both the symbols for 10 do not bear much difference. He is satisfied that the symbol is for the numeral 10. But, however, he feels it to be 'an era of omitted hundreds' and pleads the case for another Kanishka. Its reading as for the numeral 50 by V. V. Mirashi, *EI*, XXVI, 270 ff; and B. Ch. Chhabra, *ABORI*, XXXIII, 270 ff, cannot be accepted. Also cf. Sahni, *EI*, XIX, 97 where he observes that 'the present inscription is clearly dated in the year 14 of that king'.

showed deeper interest in the art of writing. The large number of private records show the attempt of many people to reproduce the accepted forms in various ways. Several new apprentices must have entered the field and those who were skilled in the art diverted their attention to the increase of speed. This was responsible for the evolution of cursive forms. The more active centres of writing evolved more cursive forms than the less busy ones, resulting in many varieties. From this point of view, Mathura, the busiest centre of political and religious activities during the period, must have taken the lead in this field. The earliest specimens of the so-called 'eastern variety' of the letters *ma*, *ha* and *sa* are found in the inscriptions from Mathura. It is not likely that the two Mathura inscriptions of Kanishka, dated in the years 4 and 14, and the Mathura inscription of Huvishka dated in the year 33 were written by writers imported from Kausambi or any other place from the eastern region. On the other hand, the Sarnath, Sahet-Mahet and Kosam inscriptions of the time of Kanishka do not show the advanced forms of these letters, even though they are differentiated in respect of the head-mark. The only conclusion which can be inferred from this is that these forms were evolved by the skilled writers of Mathura. In what circumstances these forms came to Kausambi and developed into a regional style, during the reigns of the Magha rulers, is not clear. But once accepted in this area, these forms of the Brāhmī script developed with accelerated speed.

In the inscriptions of north India we observe that speed or swiftness was the main consideration, thus producing cursive forms, and ornamentation was only secondary. The change of the triangular head-mark into a line head-mark may be mainly due to this reason. The dot for *anusvāra* and some-times three dots of *i* also similarly changed into short lines. The flourishes of the medials were also simplified.

With these introductory remarks, we may take up individual letters and trace their development.

VOWELS

Among, the vowels, the form of *a* varies much. The vertical of the letter is generally bigger than the two strokes at the left. The lower tip of the vertical is sometimes inclined to the right or to the left. This feature, though found in a few cases (XXIV. 1. i & XXVII. 1. iii) only, deserves mention because in the later period it is much elaborated. In these inscriptions the left arm of *a* received much attention. Dani¹ distinguishes two main varieties of this letter, viz. curved and angular. He notes that 'in both the varieties, the upper left stroke becomes important, but while in the cursive variety this upper stroke slants downwards to meet the vertical and the lower stroke maintains its curved form, in the angular one, the upper stroke makes an angle before meeting the vertical and tries to assimilate the lower stroke, which sometimes appears below the line'. The best example of the cursive variety is met with in the Sarnath inscription of Āsvaghosha (XXX. 1. i); the left strokes in the angular form develop in some cases into a single line attached to the vertical by a dash (XXXIII. 1. iv). Many intermediary forms are also found (Plates V and VI, line 1). The following figure will show the two lines of development :

Cursive forms : $\text{H} \rightarrow \text{H} \rightarrow \text{H}$

Angular forms : $\text{H} \rightarrow \text{H} \rightarrow \text{H} \rightarrow \text{H}$

Though the use of three dots for *i* (XXX. 2. i-iii) continues in some places, we often find three short lines in place of these dots. Two short lines are placed one upon the other and the third one is a vertical short line to the right of these two (XXVII. 2. i-ii). In a private inscription from Mathura, we find one peculiar formation which has been read by Bühler² as *i*. This is formed of a vertical with two dots on either side (XXVII. 2. iii). Such forms occur in the southern caves of the

1. *Op. cit.*, p. 86.

2. *EI*, II, p 204.

mid-second century A.D. Again, we find this form in the Haraha inscription¹ of Īśānvarman, of the sixth century A. D. There it has been read as *ṛ*. It may be suggested that here also it denotes the same sound.

The initial *u* sometimes bends its base downwards, but in the medials this bend is very advanced (XXVII. 6. i and iii), and in some cases it is extremely curved (XXVII. 6. iv). Lohuize-De Leeuw takes these forms to belong to the post-Kushāṇa period.² But her conclusions are based on the assumption that in dating some Kushāṇa inscriptions the first digit is omitted,³ a thesis which Dani rightly rejects on palaeographic grounds.⁴

The apex of the triangle of *e* is mostly to the left, which is more or less a standard form of this letter. The middle vertical of *o* is inclined.

• CONSONANTS

SIMPLE AKSHARAS

Gutturals

The top head-mark of *ka*, though continuing the Kshatrapa triangular head-mark for some time, develops into a short line head-mark. In the eastern style the head-mark does not appear at all for a while, but in the Kosam-Bāndhogarh region it appears in the form of a line head-mark. This can be seen in *da*, *na*, *pa*, *bha* and *ra* also. In the western style this line head-mark is more prominent in the private inscriptions of Mathura. Though the middle horizontal of *ka* maintains its straight form in some examples, we find it variously curved in

-
1. Dani, *IP*, Plate Xa. line 6.
 2. *SP*, pp. 270, 271.
 3. *Ibid*, p. 263.
 4. Dani, *op. cit.*, p. 86.

a majority of letters. In the Sāñchī inscription of Vaskushana (XXVIII. 39. i) the angle is more prominent.

The triangular base of *kha* now becomes more prominent and is almost standardised. In some cases, the upper hook of *kha* is less emphasised.

The round topped *ga* becomes the standard form of the period. Its left leg received much attention by appending to it a line foot-mark, which in some cases extends on both sides but in others only inwards (XXVII. 8. i; XXIX. 8. ii and XXIV. 8. i; XXXIII. 8. i-ii).

Gha is fully angularised in standard forms. Its vertical is generally straight, but in advanced forms the left vertical is slightly bent (XXXIII. 9. ii).

The letter *na* never occurs alone; we find it only in conjunction with *ga* and *gha* (XXVI. 39. i and ii).

Palatals

The beaked type of *cha* is the most accepted form of this period and appears with many variations (Plates V & VI, line 10). The triangular and quadrangular looped *cha* are also met with (XXVIII. 10. i; XXIII. 10. i-ii). Optionally the mouth of the loop of *cha* is open as in the Kosam inscription (XXXIII. 10. i).

As regard the letter *chha*, the double-looped variety seems to be most popular (Plate V and VI, line 11). The letter *ja* maintains its angular form with its vertical sometimes curved inwards. In some cases, the angular variety of *ja* is also found (XXVI. 12. i-ii and XXVII. 12. i). The lowest arm of *ja* occasionally bends downwards. *Jha* and *ña* continue their older forms; the latter is mostly to be seen in conjuncts (XXVIII. 39. ii; XXX. 39. ix & 40. i etc).

Linguals

The letters *ṭa* and *ṭha* maintain their previous forms, but whenever *ṭa* is joined with *i* or *u* medial, it shows a cursive hand.

The Kshatrapa type of *ḍa* continues (XXIII. 17. i) in some cases it develops a round back opened to the right (XXVI. 17. i).

In the advanced form of *ḍha* the base flattens and the curve develops into a loop (XXIII. 18. i; XXVI. 18. i). In the later variety the line head-mark is more marked.

The letter *ṇa* appears in many forms, which seem to be the outcome of the cursive hand. These show various stages of development, starting from the simple Aśokan type of *ṇa* having both the horizontal lines straight (XXIX. 19. ii) to the looped variety (XXVI. 19. i). In the inscriptions of Kosam-Bandhogarh region, the open-mouthed variety of *ṇa* is also found in conjuncts (XXXIII. 39. v-vi).

Forms of *ṇa* I → 𑀩 → 𑀪 → 𑀫 → 𑀬

Dentals

The lower appendage of *ta* is rounded in almost all the forms. In some cases its vertical shortens and sometimes it is totally eliminated where the *o* medial starts immediately above the back of the curve (XXVII. 20. iii). Both triangular and linear head-marks are seen in this period. In the Kanishka inscriptions of the years 4 and 14 (Table XXXI), the linear head-mark is more prominent, but this can be seen in the private inscriptions from Mathura also.

The letter *tha* shows little change and the older form continues.

Da with its curve open to the left (XXX. 22. ii) becomes rare. The angular backed *da* with two curves are also found

(XXXI. 22. ii and XXXIII. 22. iii), but in its later development the lower appendage is dropped and the cursive form again revives a round back, but this time the curve opens to the right. This form becomes standard. In Kosam-Bandhogarh region both forms are optionally used.

Dha exhibits many forms with its curve at the left of the vertical angularised. Round-backed *dha* is also seen (XXV. 23. i; XXXII. 23. i), but the angular *dha* seems to be the most accepted form.

Na bends its base to various degrees. In some cases it goes to the extent of resembling the letter *ta* (XXXIII. 24. ii). Such forms are more frequent in the Kosam-Bandhogarh area.

Labials

Pa occurs only in its angular variety, with its left arm curved in some cases. In the majority of cases only the left arm receives the head-mark, and the medial signs for *ā*, *i*, *o* etc. are generally attached to this arm. Sometimes the base line is also slightly bent.

The letter *pha* also occurs only in the angular variety with a head-mark.

Ba retains its square shape, but in the Kosam region its left side is slightly bent (XXXIII. 27. i); in the later period this feature develops into a notched variety of *ba*.

Bha develops on two distinct lines. Dani¹ distinguishes two types of this letter. According to him in the first type 'the middle bar slants upwards and the right arm is elongated, both making an angle at the apex'. He calls this the angular type of *bha*. In the second type, 'the middle bar is elongated and finally notched, with two curved arms at either end'. This he calls a notched *bha*. The development of the two forms are traced as follows :

1. *Op. cit.*, p. 87.

Angular type : $\text{d} \rightarrow \text{d} \rightarrow \text{d} \rightarrow \text{d}$

Notched type : $\text{d} \rightarrow \text{d} \rightarrow \text{d} \rightarrow \text{d}$

The most frequent type of *ma* of this period is formed of a triangular base with its arms making a St. Andrew's Cross. But the older type of *ma*, with circular or triangular-looped base and with curved arms, is also seen. This letter develops further with striking speed and completely changes its face. It plays upon its triangular base which 'first flattens out and then the triangle is placed on one side. In one case the base of the triangle merges with the longer arm, producing a tailed *ma*. In the other case the apex of the triangle opens and we get an open-mouthed *ma*.'¹

A. $\text{X} \rightarrow \text{Z} \rightarrow \text{V}$

B. $\text{X} \rightarrow \text{Z} \rightarrow \text{Z} \rightarrow \text{Z} \rightarrow \text{Z}$

The advanced forms of *ma* are seen in the Mathura inscriptions of Kanishka and Huvishka and in the inscriptions of Kosam-Bandhogarh area (see Plate VI, line 29), side by side with the older forms. It is not possible to trace any big gap between these forms.

Semi-Vowels

The letter *ya* flattens its base and appears in various forms. 'This base bends gracefully to give differential effect to the three uprights, which received special attention. The left arm develops its line head-mark into a curl and finally into a loop, and the middle arm inclines to the left, while the right presses downwards to balance the loop in the left'.² (See plates V and VI, line 30 for these forms). In subscript, this tripartite form changes itself into a bi-partite or hooked form. We will notice this while dealing with the conjuncts.

1. Dani, *op. cit.*, p. 83.

2. Dani, *op. cit.*, pp. 87-88.

Ra is mostly a straight tapering vertical with a triangular or line head-mark. Occasionally its lower tip is bent. Very rarely we find a stepped variety of *ra* (XXX. 31. i), reminding us of a serpentine *ra*, which is optionally used in subscript or super-script (XXX. 39. i and 41. viii).

The right vertical of *la* is usually straight; sometimes it is gently curved towards the left. As we have noticed earlier, the left hook of *la* had taken an angular shape in the Kshatrapa period. Now it further develops and does away with the small tick, which now appears in the form of a hook pointing downwards (XXXI. 32. i; XXXIII. 32. i.). This most advanced type of *la* appears for the first time in the Kanishka inscription of the year 14 and again met with in the Magha inscriptions.

The letter *la* (Plate V, line 33) has a significant history of its decipherment. Though it was first noticed by Bühler in the Kshatrapa inscriptions, already dealt with in the previous chapter, he could not give proper treatment to this letter in the Kushāṇa records. Wherever this letter appears, he deciphered it as a conjunct of double *ṭa*. Others also followed Bühler.¹ But whenever two *ṭas* are conjoined, they are placed one upon the other and linked by a small vertical line (XXVI. 39. iii; XXVII. 42. i; XXXIII. 39. iv). Lüders, in his *Mathura Inscriptions*, reads this letter as *la*.² As regards its origin, we are convinced that this letter is derived from the letter *ra*³, and Dani's⁴ derivation is not acceptable.

The triangular form of *va* became the standard form of this period, though the private inscriptions from Mathura show some other forms also (XXVII. 34. ii-iv, XXVI. 34. iii). The vertical of the letter shortens and in many cases disappears

-
1. E. g., Banerji, R.D., *EI*, X, 110, No. 3, line 2 etc.; Sahni, D.R., *EI*, XIX, 67, No. IV, line 3.
 2. P. 46 etc.
 3. *Supra*, p. 75.
 4. *Op. cit.*, p. 55.

(Plates V & VI, line 34), but the triangular or the line head-mark persists. Emphasized triangular head-mark of Kshatrapa period does not appear as it could not become popular.

Sibilants & *Ha*

The curved form of *śa* is standardised and, like *ga*, it also develops a triangle or line foot-mark (XXVI. 35. ii; XXVII. 35. ii, iii & v).

The letter *sa* also takes a rapid course of change. First the upper curve of *sa* takes a definite angle (XXVI. 37. i) although it does not play an active part in the process of changes. The change takes place when the left hook of *sa* becomes a part of the left stroke and is attempted in a single action. This process produces first a small knob and then a loop. $\text{ś} \rightarrow \text{ś} \rightarrow \text{ś} \rightarrow \text{ś} \rightarrow \text{ś}$

The letter *ha*, already angularised in the Kshatrapa period, also changes very rapidly. Its insignificant tick to the right first curves, then straightens the original curve of the letter and finally replaces it, changing the shape of the letter entirely (Plates V & VI, line 38). $\text{h} \rightarrow \text{h} \rightarrow \text{h} \rightarrow \text{h} \rightarrow \text{h}$

COMPOUND AKSHARAS

The important conjuncts are found in the following groups :

1. Groups with initial gutturals :

- A. (a) *kka* (XXVIII. 39. i)
- (b) *khh* (XXIII. 41. iii; XXXI. 39. i)
- (c) *kta* (XXX. 39. iii)
- (d) *kra* (XXX. 39. i)
- (e) *kri* (XXX. 39. ii)
- (f) (i) *ksh* (XXIV. 39. i; XXX. 39. iv)
- (ii) *kshi* (XXIII. 41. iv; XXX. 39. v)
- (iii) *kshu* (XXVII. 40. vii; XXXII. 39. i)
- (iv) *kshe* (XXXIII. 39. i).

- B. (a) *gni* (XXX. 39. vi)
 (b) *gra* (XXIV. 39. ii)
 (c) *gri* (XXIII. 39. i; 41. v; XXIV. 41. i; XXVI. 40. v, 41. i; XXX. 39. vii; XXXII. 39. ii; XXXIII. 39. ii),

To show the subscript *ra*, the right leg of *ga* is slightly elongated and then turned to the left, while to denote a *ri* subscript, a slanting stroke is added to the right leg. Sometimes this stroke takes different shapes (XXVI. 41. i; XXXIII. 39. ii). These forms of the subscript *ra* or *ri* are followed in almost all letters.

- C. (a) *nga* (XXVI. 39. i)
 (b) *nga* (XXVI. 39. ii)

2. Groups with initial palatals :

- A. *chchha* (XXVI. 39. iv)
 B. *chhri* (XXX. 39. viii)
 C. (i) *jñā* (XXX. 39. ix)
 (ii) *jño* (XXVIII. 39. ii; XXX. 40. i)
 D. *ñcha* (XXX. 40. ii; XXXIII. 39. iii)

3. Groups with initial lingual :

- A. (i) *ṭṭā* (XXXIII. 39. iv)
 (ii) *ṭṭi* (XXVII. 42. i)
 (iii) *ṭṭo* (XXVI. 39. iv)
 B. (i) *ṇḍa* (XXV. 39. ii; XXIX. 39. iii; XXXI. 39. ii)
 (ii) *ṇḍha* (XXXIII. 39. v)
 (iii) *ṇya* (XXXIII. 39. vi)

The open mouth *ṇa* in the last two examples deserve special notice.

4. Groups with initial dental :

- A. (a) *ṭkri* (XXX. 40. iv)
 (b) *tvo* (XXIV. 39. iii)

- (c) (i) *tra* (XXIII. 39. iii; XXV. 39. i; XXVII. 42. ii; XXX. 40. iii; XXXI. 38. iii; XXXII. 39. iii)
 (ii) *tri* (XXVI. 39. v)
 (iii) *tre* (XXIX. 39. ii; XXXII. 40. i; XXXIII. 40. i)
 (iv) *tro* (XXIII. 39. ii; XXV. 40. iii)
 (v) *tri* (XXVII. 42. v)

It is not difficult to distinguish between the subscript *ra* and *ri*. *Ta* with hollow head-mark is noticeable in Huvishka's inscription (XXXII. 39. iii).

- (d) *tsa* (XXXI. 39. iv; XXXIII. 40. ii and iii).
Ta is combined with a developed form of *sa* as well as older *sa*.

- B. (a) *dga* (XXXIII. 40. iv)
 (b) (i) *ddha* (XXIV. 39. iv; XXIX. 40. i; XXXI. 40. i; XXXII. 40. ii)
 (ii) *ddhi* (XXXIII. 40. v)
 (iii) *ddhya* (XXIX. 40. ii; XXXI. 40. ii)
 (c) *dbhih* (XXX. 40. v)
 (d) *dya* (XXVIII. 40. i; XXX. 40. vi)
 (e) (i) *dra* (XXVI. 40. ii)
 (ii) *dri* (XXVI. 40. iii)
 (f) (i) *dva* (XXVII. 39. ii)
 (ii) *dvi* (XXV. 40. i)
 (iii) *dve* (XXVII. 39. i)

Da with its curve open to the left is noteworthy in this period (XXX. 40. vi). The subscript *ya* appears both in its tripartite and bi-partite forms. The course of their development is traced while dealing with the conjuncts with initial *sa*.

- C. (a) *nte* (XXXII. 40. iii)
 (b) *ndi* (XXVII. 39. iii-iv)
 (c) *ndra* (XXVII. 41. vii)
 (d) *nnri* (XXIV. 39. v)
 (e) *nyū* (XXX. 40. vii)

5. Groups with initial labial :

- A. (a) *pñā* (XXVII. 39. v) a wrong combination;
 (b) *pta* (XXX. 40. viii)
 (c) (i) *pra* (XXV. 39. iii; XXVIII. 40. ii; XXX. 40. ix; XXXI. 40. iii).
 (ii) *pri* (XXIV. 39. vi; XXX. 40. i)
 (iii) *pro* (XXIV. 39. vii)
 (iv) *pri* (XXVI. 40. iv)
- B. *bra* (XXVI. 42. i)
- C. (a) *bhrā* (XXVII. 41. v; XXXIII. 41. i).
 (b) *bhr̥* (XXX. 41. ii)
- D. (i) *mba* (XXVII. 40. v)
 (ii) *mbu* (XXIV. 40. i)

6. Groups with initial semi-vowels :

- A. (i) *yya* (XXVII. 40. i)
 (ii) *yyo* (XXVII. 39. vi)
- B. (a) *rñṇa* (XXVII. 42. iii)
 (b) *rtiḥ* (XXX. 41. iii)
 (c) *rttha* (XXIX. 40. iii; XXXI. 40. iv XXX. 41. iv with *visarga*).
 (d) (i) *rtha* (XXIV. 40. iv; XXV. 40. iv; XXX. 41. v).
 (ii) *rthi* (XXX. 41. vi).
 (e) *rdḍha* (XXVI. 42. ii; XXX. 41. vii)
 (f) (i) *rma* (XXX. 41. ix)
 (ii) *rmma* (XXXIII. 41. ii)

(g) *ryya* (XXIII. 39. iv; XXVI. 40. i; XXVII. 39. vii; XXI. 41. i; XXXIII. 41. iii).

(h) (i) *rva* (XXIV. 40. iii; XXX. 41. viii)

(ii) *rvva* (XXIII. 39. v; XXV. 40. ii; XXVII. 40. ii-iii; XXVIII. 41. i; XXXI. 41. ii-iii).

(i) *rsha* (XXV. 39. iv; XXX. 42. i; XXXIII. iv)

C. (a) *lla* (XXIX. 41. i; XXXIII. 41. v)

D. (a) *vri* (XXIV. 40. ii; XXVII. 40. iv; XXX. 42. ii)

7. Groups with initial sibilants :

A. (a) *ścha* (XXIX. 41. ii)

(b) *śya* (XXXVI. 41. ii; XX. 42. v)

(c) (i) *śra* (XXVII. 41. vi)

(ii) *śrā* (XXVI. 41. iii)

(iii) *śri* (XXXIII. 42. i)

(iv) *śri* (XXIV. 40. v; XXX. 42. vi; XXXIII. 41. vi)

(d) *śva* (XXX. 42. iii-iv)

B. (a) (i) *shka*, (XXIV. 40. vi; XXIX. 42. i; XXXI. 41. iv; XXXII. 41. i)

(ii) *shko* (XXIII. 40. iii)

(b) (i) *shṭā* (XXIV. 40. vii; XXVIII. 41. ii)

(ii) *shṭo* (XXX. 42. vii)

(c) (i) *shṭha* (XXIII. 50. ii)

(ii) *shṭhā* (XXIX. 41. iii; XXXI. 42. i)

(d) *shma* (XXXIII. 42. ii), curved type of *sha* is to be marked here.

(e) *shyo* (XXIII. 40. i)

C. (a) *sku* (XXVIII. 42. i)

(b) *scha* (XXVI. 41. iv)

(c) *stu* (XXVII. 42. iv)

(d) *smim* (XXXI. 42. ii)

- (e) *sya* (XXIII. 40. iv-v; 41. i, 42. i; XXIV. 41. i-iii; XXV. 41. ii-iii; XXVI. 41. v; XXVII. 41. i-iv; XXVIII. 42. ii; XXIX. 42. ii; XXX. 42. ix; XXXI. 42. iii-iv; XXXII. 41. ii-iii; 42. i-ii; XXXIII. 42. iii-iv).

The formation of *sa* in *sku* (XXVIII. 42. i) and *sya* (XXVIII. 42. ii) where the left hook turns upwards is a peculiar one. Different stages of the development of subscript *yā* from the tripartite form into a bi-partite form can be noticed in these conjuncts. Below, we give the main stages in summarised form.

𑀭𑀸𑀓 → 𑀭𑀸𑀓 → 𑀭𑀸𑀓 → 𑀭𑀸𑀓

Medial Signs

The system of medial signs used in the pre-Kushāṇa inscriptions (Plate IV, Table No. XVIII), discussed in the preceding chapter,¹ was much elaborated in this period. However, there was no fundamental change.

The dot denoting *anusvāra* was occasionally replaced by a short dash and was generally put above the letter. However, a dot for the *anusvāra* also continued.

The visarga continues its older form.

Punctuation Marks

In private inscriptions of Mathura, a vertical line is sometimes found and can be taken as an inter-punctuation mark.

Numerals

The earliest use of numerals is found in the inscriptions of Aśoka,² where only 4, 6, 50 and 200 are used. But in the period of the Mathura Kshatrapas and Kushāṇas we find an extensive use of numerals.

1. *Supra*, p. 104 ff.

2. Upasak, *HPMB.*, p. 122 ff.

Pt. Bhagwanlal Indraji¹ and Bühler² are convinced that these numerals are based on the *aksharas* or syllables of the Brāhmī script. A superficial observation of these signs leaves no doubt about the correctness of the views of these scholars. But when individual signs are carefully studied, one feels that, though particular letters or conjuncts were originally used as symbols for definite numbers, no pains were taken to stick to the original forms and these numerals developed independently.³ In some cases, it is almost impossible to trace the original shape; for example, compare some forms of 8, 10, 50 etc. on Plates V and VI. Again, it may also be pointed out, even if it goes against the *Akshara* theory,⁴ that though the letter *tha*⁵ is said to denote the number 20,⁶ another form of this letter, a vertical line inside the circle, denotes the number 80; and a combination of the middle lines of 20 and 80, i. e., a plus mark inside the circle, makes it 90. This means that these signs do not point to any letter or conjunct but stand by themselves. Secondly, in the Aśokan inscriptions, there are at least three different signs for 200⁷ and not all of them can be equated with the Brāhmī letter *su* or *shu*. In our opinion the origin of these numerals may possibly be traced in one or the other letter, but no connection between the letter and the

1. *IA*, VI. 43.

2. *Ibid.* p. 47.

3. Cf. Indraji who holds that 'the variations which occur in their forms in the inscriptions of different dynasties and centuries are caused chiefly by the variations of the forms of the letters in the alphabets of the same times and dynasties'. *IA*, VI. 43.

4. Our study of numerals is limited only to the five centuries covered in this work and hence these observations have their own limitations and are true only with reference to this period.

5. It may be pointed out here that a horizontal dash in the circle is nearer to the usual form of the Greek letter *theta* than the Brāhmī *tha* where only a dot is put in the circle.

6. *IA*, VI. 47.

7. Upasak, C. S., *op. cit.* p. 123.

denomination that it represents can be established; these letters were simply utilised as convenient symbols and evolved very rapidly.

The numerals 1, 2 and 3 are expressed by horizontal strokes; numbers 4-9 & 10-90 & 100 have separate signs for each. To express 200 a short stroke is added to the right side of the sign for 100.¹

The sign for 4 resembles the Brāhmī letter *kī* (XXVI. 43. 11); but in the majority of the symbols, the so-called long *ī* medial finds its place to the left of the vertical. Numeral 5 resembles the Brāhmī letter *ñā* of this period. In the Gupta period the hook at the right changes its place and comes to the left; Indrajī takes this for the conjunct *tri*.² The symbol for 6 resembles the cursive form of Brāhmī *ja*. It changes its shape very frequently and, in the Bandhogarh inscriptions, appears in a peculiar form (XXXIII. 44. i-ii). The sign for 7 resembles *ga* with its right leg lengthened, which Indrajī takes for *gra*. The numeral 8 resembles Brāhmī *ha* with its right hook lengthened. A very cursive form of this numeral is found in the Kailvan inscription³ (XXXIII. 44. iii). Possible stages of such a transformation are restored here.

𑀓 → 𑀓 → 𑀓 → 𑀓

We are not sure about the letter that served as the model for the symbol for 9. Indrajī⁴ takes it for the letter *o*, which is not likely in this period. However, we find many variations of it (XXIV. 44. i a and b; XXVI. 44; XXVII. 43. v; XXIX. 43. ii-iii; XXX. 43. ix).

The sign for 10 in many inscriptions resembles clearly the Brāhmī letter *ma* with its open side to the right (XVIII. 42. iii; XXIV. 43. ii b; XXV. 43. iv; XXVI. 44. iii-iv; XXVII. 43. vi;

1. Bühler, *IA*, VI. 155; and *IP.*, p. 97.

2. *IA*. VI. p. 46, cf. also his chart on p. 44, column IV, line 5.

3. *EI*. XXXI. 230.

4. *Op. cit.*, p. 46.

XXVIII. 43. ii; XXIX. 44. i). From other cases, it appears that various formations developed out of this sign (XXIII. 44. i-ii; XXIV. ii a; XXVII. 43. vii; XXIX. 44. ii; XXXI. 43. iii-iv; XXXIII. 43. iv). It is not possible to agree with Indraji¹ that this numeral resembles *la*, because in *la* we always have a head-mark, which is lacking here. (Cf. Plate V line 33 also).

As indicated above, the numbers 20, 80 and 90 are formed by a circle with a horizontal, a vertical line and a cross inside it respectively. Many varieties emerge out of this form; e. g., see XXV. 44. iii; XXVII. 44. vii for 80 and XXVI. 44. v; XXVII. ia & b; XXVIII. 44. i for the numeral 20.

The sign for 30 resembles Brāhmī *la* but its right vertical is some times equal to the left one (XXIV. 44. iv a & b; and also XXXII. 48. iii).

There has been much confusion regarding the reading for the numerals 40, 60 and 70. The sign for 40 resembles the compound letter *pta* of Brāhmī, which Bühler sometimes reads as 70.² And the sign for 60 resembles Roman capital letter V which again has been mistaken by Bühler for 40.³ The sign for 70 resembles a St. Andrew's cross.⁴

The numeral for 50 may be taken to resemble the *jihvā-mūliya*, but put in a different position (XXIV. 43. vi; XXVII. 43. iv a and b).

The sign for 100 may be taken to resemble *su* (XXXIII. 44. v) in one case and *to* (XXXIII. 44. iv) or, slightly, *śu*⁵ in the other case. The sign for 200 (XVIII. 42. v) is like the former, with an additional tick to the right denoting that its potency has been raised to 200.⁶

V. Private Inscriptions from Mathura : years 25-98 :

1. Inscription of year 25, *EI*, Vol. I, p. 384, no. 5.
2. Inscription of year 26, Lüders, *MI*, p. 62, pl. on p. 268.
3. Inscription of year 28, *IA*, Vol. VI, p. 217, no. 1.
4. Inscription of year 31, *EI*, Vol. II, p. 202, no. 15.
5. Inscription of year 32, *EI*, Vol. II, p. 203, no. 16.
6. Inscription of year 35, *EI*, Vol. I, p. 385, no. 7.
7. Inscription of year 45, *EI*, Vol. I, p. 387, no. 10.

8. Inscription of year 47, *EI*, Vol. I, p. 396, no. 30.
9. Inscription of year 49, *EI*, Vol. II, p. 204, no. 20.
10. Inscription of year 50, *EI*, Vol. II, p. 203, no. 17.
11. Inscription of year 50, *EI*, Vol. II, p. 209, no. 36.
12. Inscription of year 52, *EI*, Vol. II, p. 203, no. 18.
13. Inscription of year 54, *EI*, Vol. I, p. 391, no. 21.
14. Inscription of year 63, *EI*, Vol. II, Vol. II, p. 204, no. 21.
15. Inscription of year 77, *JRAS*, Vol. V, p. 183, no. 2.
16. Inscription of year 81, *EI*, Vol. II, p. 204, no. 19.
17. Inscription of year 86, *EI*, Vol. I, p. 388, no. 12.
18. Inscription of year 87, *EI*, Vol. I, p. 388, no. 13.
19. Inscription of year 90, *EI*, Vol. II, p. 205, no. 22.
20. Inscription of year 92, *EI*, Vol. XXXIV, p. 11.
21. Inscription of year 93, *EI*, Vol. II, p. 205, no. 23.
22. Inscription of year 95, *EI*, Vol. I, p. 392, no. 22.
23. Inscription of year 98, *EI*, Vol. II, p. 205, no. 24.

VI. Sāñchi Inscription of Vaskushāṇa : year 22 :

Marshall, J., *MS*, Vol. III, pl. CXXXVIII, no. 53.

VII. Sarnath, Sahet-Mahet and Kosam Inscriptions of Kanishka :

1. Kosam Inscription of Kanishka : year 2, *EI*, Vol. II, p. 212.
2. Sarnath Inscription of Kanishka : year 3, *EI*, Vol. VIII, pp. 176-79.
3. British Museum Inscription of Kanishka : year 10, *EI*, Vol. IX, p. 240.
4. Sahet-Mahet Inscription of year 19, *EI*, Vol. VIII, p. 181.
5. Sahet-Mahet Umbrella Staff Inscription, *EI*, Vol. X, p. 291.

VIII. Inscriptions of Kushāṇa Times :

1. Allahabad Museum Inscription of year 23, *EI*, Vol. XXIV, p. 250-51.
2. Sarnath Inscription of Aśvaghosha : year 40, *EI*, Vol. XXIV, p. 172.
3. Prahalpur Pillar Inscription, Fleet, J. F., *CII*, Vol. III, p. 250, pl. XXXVI A.

IX. Mathura Inscriptions of Kanishka : Eastern Style :

1. Inscription of Kanishka : year 4, *EI*, Vol. XXXIV, p. 10.
2. Inscription of Kanishka : year 14, *EI*, Vol. XIX, p. 97.

X. Mathura Inscription of Huvishka : year 33 : Eastern Style :

1. *EI*, Vol. VIII, p. 182.

XI. Inscriptions from Kosam and Bandhogarh Regions : years 52-108 : Eastern Style :

1. Ginja Inscription of Bhimasena : year 52, *EI*, Vol. III, pl. opposite p. 306.
2. Kosam Inscription of Bhadramagha : year 81, *EI*, Vol. XXIV, p. 256.
3. Allahabad Museum Inscription of year 87, *EI*, Vol. XXIII, p. 247-48.
4. Kosam Inscription of Śivamagha. *EI*, Vol. XVIII, p. 159, no. 2.
5. Kosam Inscription of Bhadramagha; year 88, *EI*, Vol. XVIII. p. 160, no. 3.
6. Kosam Inscription of Vaiśravaṇa : year 107, *EI*, Vol. XXIV. p. 147.
7. Inscriptions from Bandhogarh, *EI*, Vol. XXXI, pp. 167-86.
8. Kailvan Inscription of Viśākhamitra : year 108, *EI*, Vol. XXXI, p. 231 ff.

HOW TO CONSULT TABLES

Every table of explanation has six columns. The first one contains the serial number of the letters illustrated in the table. The second column bears numbers which are indicative of the horizontal lines in the plates. The column three has number in small Roman indicating the vertical subcolumn of the table on the given plate. In the next column the transliteration of the illustrated letter is given while in the fifth one that word is given in which that particular letter occurs. The sixth column gives reference. In the beginning of every explanation references are quoted, and every reference is given a separate code in the form of alphabet or number. In this column small l. denotes the line of the inscription in reference.

 Bharhut, 18, 58, 59, 60, 61, 62, 65, 66, 70, 71, 72, 80, 86, 92, 95, 96, 97, 99, 101, 105
 Bhattiprolu, 31
bhikshus, 58
 Bhilsa, 58, 70
 Bhimsena, 11, 114
 Bhitā, 64
 Bihar, 92, 114
 Bijayagadh, 109
 Bloch, T., 38
 Bodh Gaya, 20, 28, 60, 61, 84, 85, 86, 92, 94, 95, 97, 99, 101, 104
 Boyer, M., 34
 Brāhmī, 1, 3, 5, 14, 23, 39, 46, 48, 51, 55, 56, 57, 59, 62, 64, 66, 75, 79, 80, 82, 83, 106, 109, 112, 114, 116, 117, 131, 132, 133
 Brihaspati, 87
 Bühler, 3, 10, 13, 19, 25, 28, 29, 31, 35, 36, 44, 48, 52, 92, 93, 102, 118, 124, 131, 133

C

Chanda, R. P., 36, 53, 59, 60, 61, 62
 Chandragupta Maurya, 87, 88, 89
 coins of series II, 18
 coins of series III, 20
 coins: die-striking, 17; —incuse-stamping, 17; —technique of casting, 17
 23, 25; —technique of, 18; —technique of punching, 17; —writing appeared on, 17
 compound *aksharas*, 38, 53, 73, 77, 102, 125
 conjunct, 33, 38, 39, 53, 120, 121, 125, 127, 130, 132
 conjunct *kyi*, 16, 17, 38
 consonants, 9, 49, 66, 119
 counter-mark, 49, 51
 countermarking, 45
 Cunningham, A., 80, 92
 cursive forms, 118

D

Dani, A. H., 10, 11, 19, 23, 25, 26, 34, 37, 38, 45, 72, 75, 76, 82, 92, 94, 100, 112, 116, 118, 119, 122, 124
 Dasaratha, 10, 11, 23, 31, 36, 37, 40, 39, 60
 Dasgupta, C. C., 36
 Diringer, David, 3
 De la Vallée-Poussin, 89
 Delhi-Topra—P. E., 9
 Demetrius, 86, 87
 Dentals, 30, 50, 54, 70, 103, 121, 126
 Dhanabhūti I, 85
 Dhanabhūti II, 85
 Dhana(Deva), 84, 90
 Dharmapala, 17, 31, 44, 45, 47, 48, 41
 Dhauli RE, 9
Dimata, 86
Dojoka, 45, 48, 50, 51

E

Eastern style, 20, 114
 'eastern variety', 117
 Egyptian syllabary, 3
 engravers, 9, 26
 engraving, technique of, 9
 epigraphy and palaeography, 21
 Erakanya, 17, 46, 52
 Eran, 42, 44, 51
 Erragudi, 9, 26
 Ethiopic, 2
 Eythedemus, 86

F

Fleet, J. F., 28, 29
 formal (visual) element (in script), 5
 formation of the heads at the top, 19
 Führer, A., 84

G

Ganeshra, 96
 Garuda-pillar, 46
 Gelb, I. J., 2, 3, 5, 21
 Ghataka, 96
 Ghosundi, 58, 62, 77
 Greek, 44, 45, 55, 57, 82
 Greek coins, 43
 Gujjar, 9
guṇa combination, 66
 Gupta, 114; —Imperial, 19; —forms, 115
 Gutturals, 27, 49, 53, 66, 94, 102, 119, 125
 guttural nasal, 9

H

Haldar, R. R., 76
 Hathigumpha, 5, 9, 86, 89, 90, 92, 94, 95, 97, 98, 99, 101, 105
 Hathipalas, 91
Hathiparas, 91

Haraha inscription, 119
 head-mark, 117, 127
 Heliodorus, 18, 46, 47, 48, 49, 61, 65
 Hultzsch, E., 78, 79
 Huvishka, 11, 113, 114, 115, 116, 117, 123
